MySpace Notes

UI & FEATURE OVERVIEW · referenced to Google Keep

Every page of the app, drawn and explained in simple words — the map we build from.
Gold numbers on each screen match the explanation list beside it. [NEW] = to be built,
[EXISTS] = already working today, [UPGRADE] = exists but grows Keep-grade.

100 features selected · 8 decisions waiting for you (last page) · 5 build phases
Companion documents: NOTES-PLAN.md (the full 100, in detail) · MASTERCLASS.md (how we work)

THE 12 NOTE COLOURS — DARK THEME

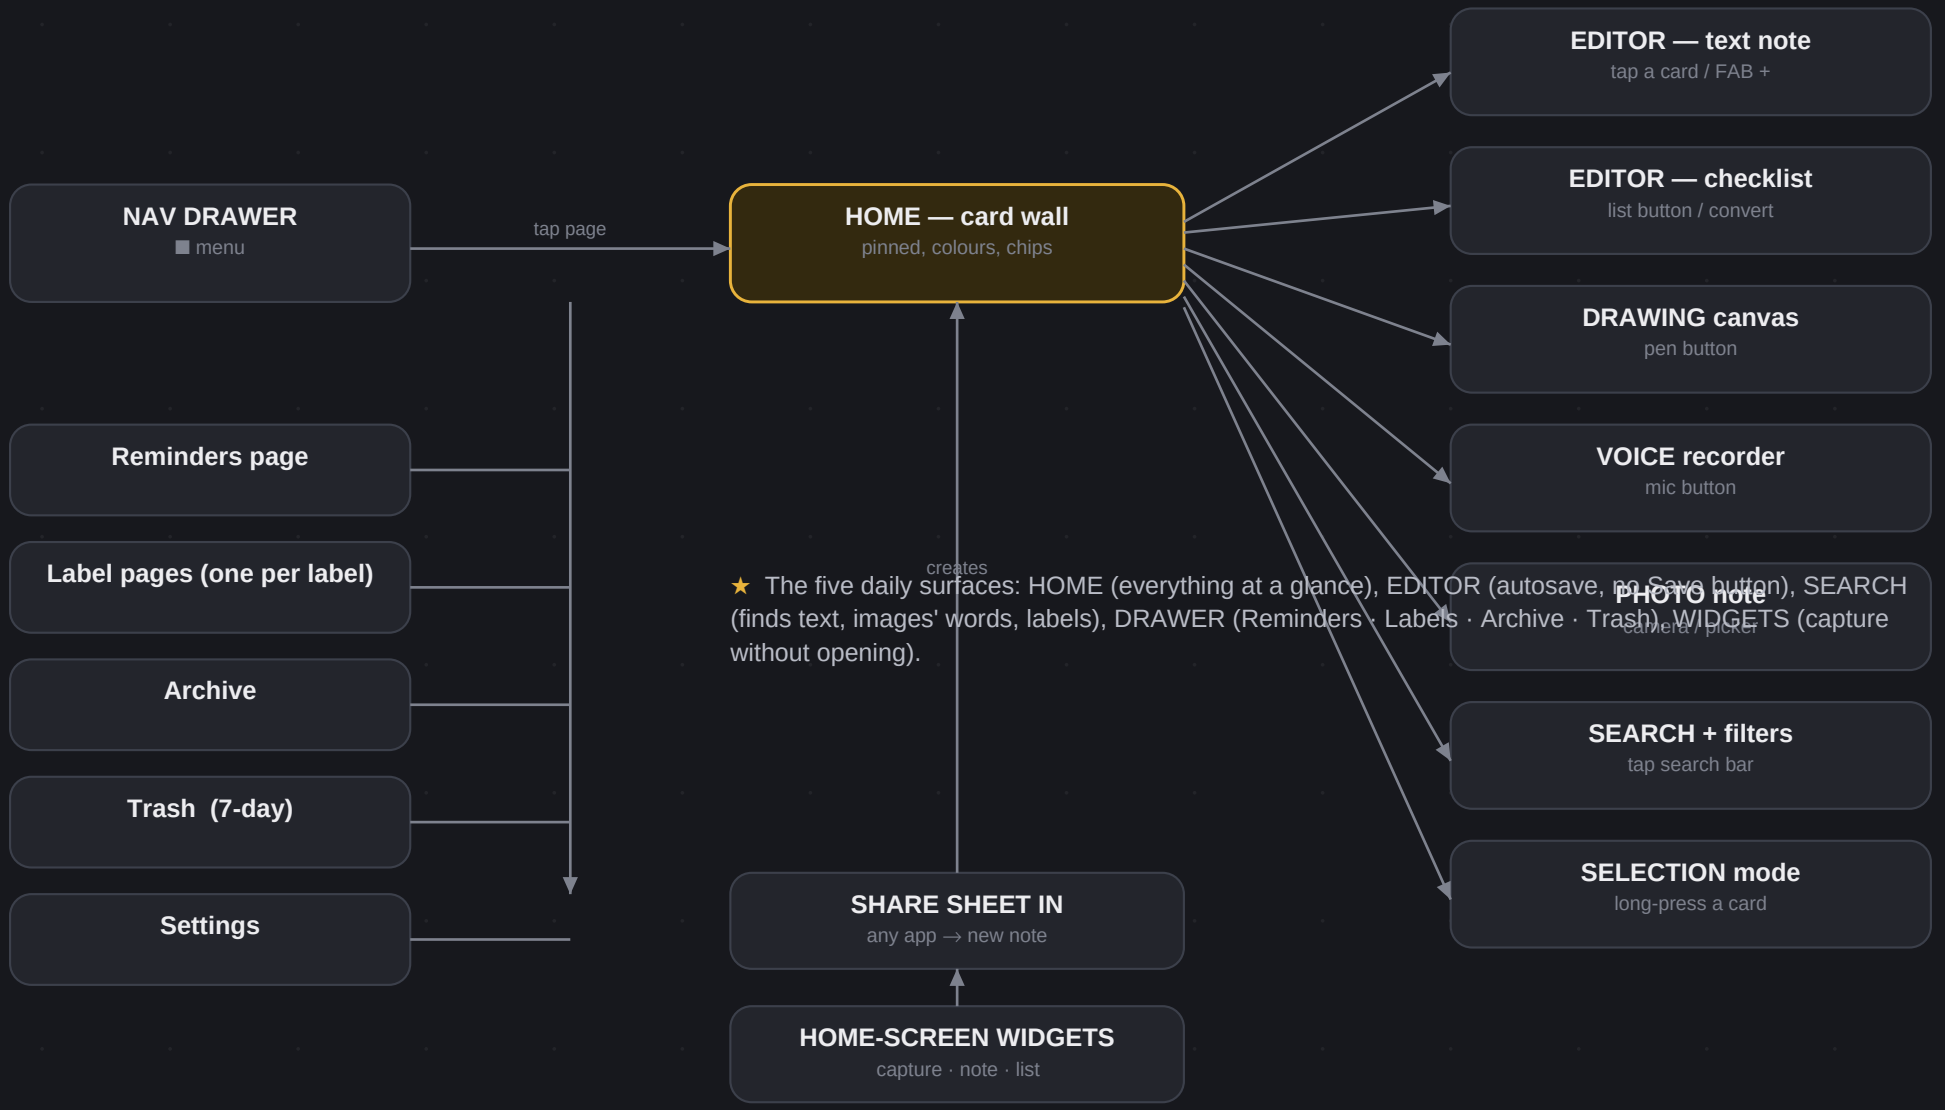

LIGHT THEME

2026-10-27 · prepared for the owner · the calculator stays frozen while Notes is built (microservice rule)

The app map — every page and how you reach it

One drawing of the whole app. Boxes are pages; arrows are taps.

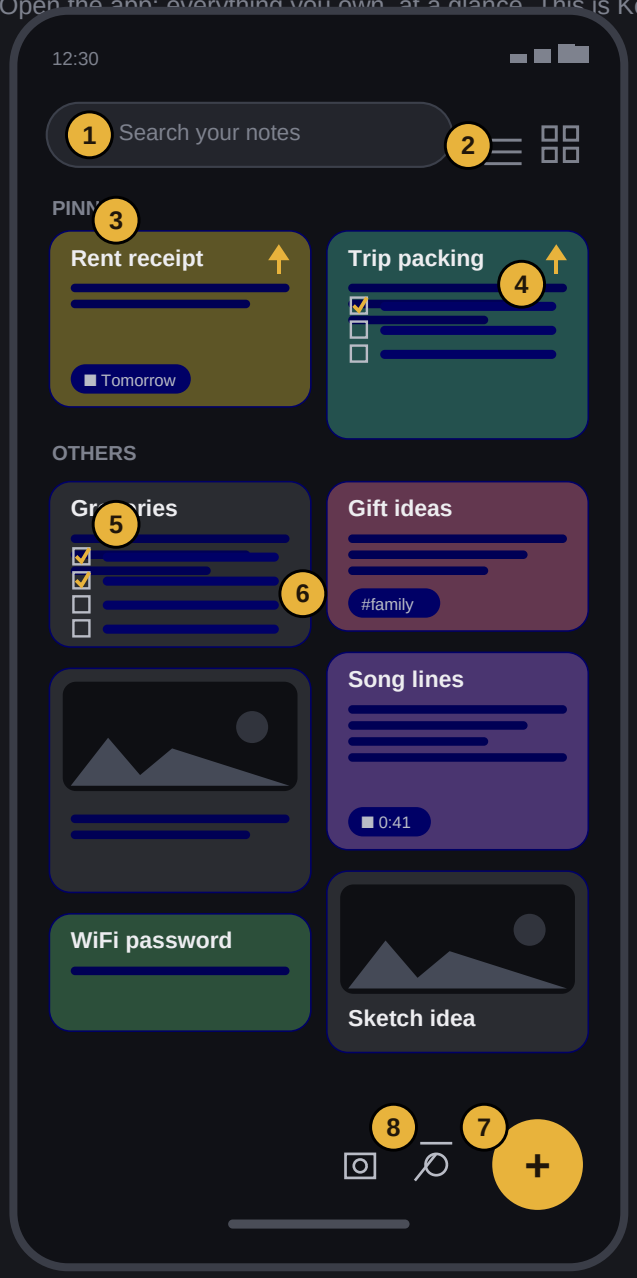

★ The five daily surfaces: HOME (everything at a glance), EDITOR (autosave, no Save button), SEARCH (finds text, images' words, labels), DRAWER (Reminders · Labels · Archive · Trash), WIDGETS (capture without opening).

everything works offline, with no account — the whole map lives on the phone

Page 1 — Home, the card wall

Open the app: everything you own, at a glance. This is Keep's face, and ours.

What you see, in simple words

1 Search bar — tap and type; notes filter while you type (off-thread, so it never lags). [UPGRADE]

2 Drawer ■ and view toggle — menu on the left; the squares icon switches the wall between two columns and one. [NEW]

3 "Pinned" section — pinned notes always ride on top, under their own small header. [UPGRADE]

4 Pin mark — gold pin on the card corner; pinning is one tap in the editor too. [EXISTS]

5 "Others" section — newest first. New notes always land here at the top. [UPGRADE]

6 Colours — 12 Keep colours paint whole cards; every colour is contrast-checked so text stays readable in dark and light. [UPGRADE]

7 FAB "+" — one tap opens a fresh note with the keyboard already up. Back = saved. There is no Save button, like Keep. [EXISTS]

8 Quick-capture row — beside the FAB: new checklist, new drawing, new voice note, new photo. Four taps to any note type. [NEW]

9 Chips on cards — a card shows what it carries: ■ reminder time, ■ audio length, #label names — without opening it. [NEW]

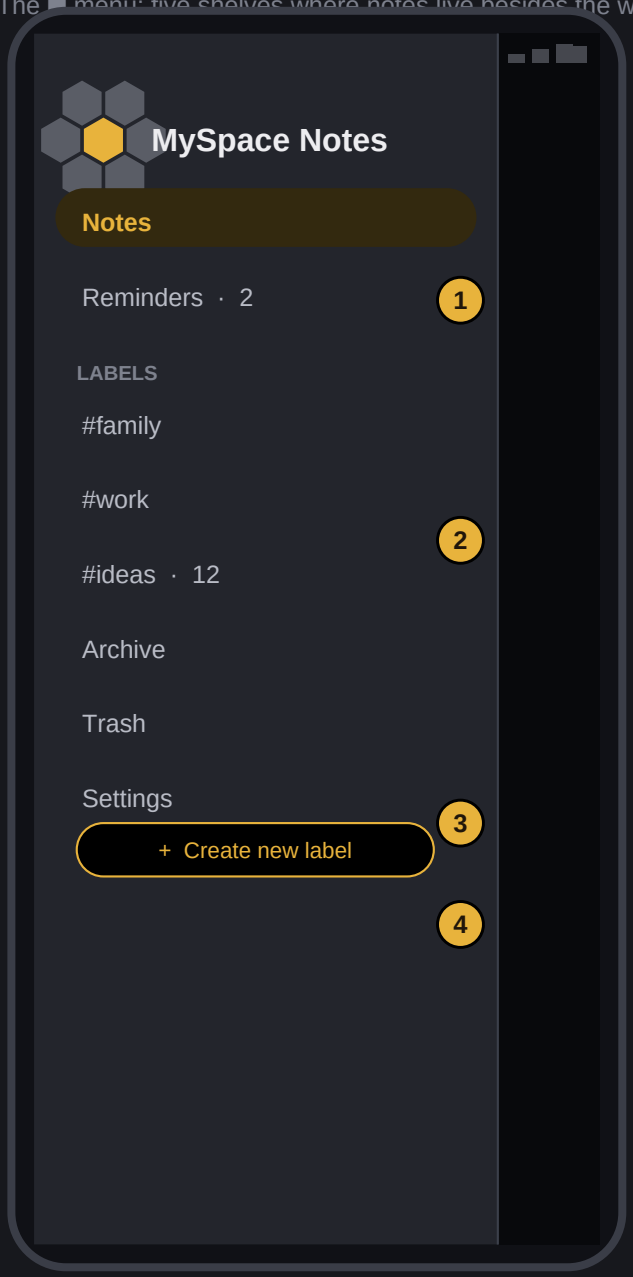

10 Image & drawing cards — the picture IS the card; text sits under it. Tap for the full-screen viewer. [NEW]

11 Long-press any card — selection mode for bulk actions (page 11). Long-press + drag reorders the wall (ships last — riskiest gesture). [NEW]

Empty states speak: when a section has nothing, it says what belongs there — never a dead screen.

Page 2 — The drawer, Archive, Trash, Reminders, Settings

The ☰ menu: five shelves where notes live besides the wall.

1 **Reminders shelf** — every note with an upcoming reminder, soonest first. [NEW]

2 **Labels shelf** — your labels listed like folders, but one note can live in many. Create up to 50. [NEW]

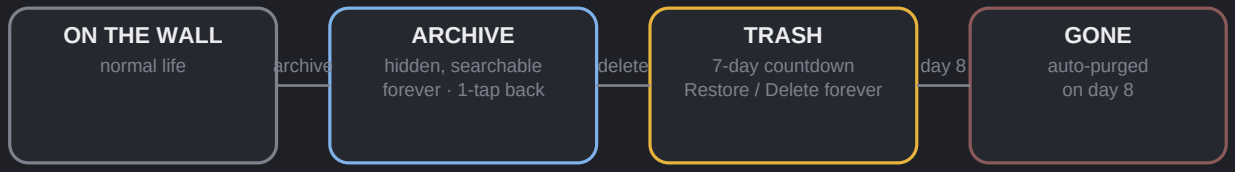

3 **Archive** — filed away, still searchable and editable. Filing, not shredding. [EXISTS]

4 **Trash** — deleted notes rest 7 days; restore, delete forever, or empty in one tap. [NEW]

5 **Settings** — theme (dark/light/system), font size S/M/L, list behaviour, reminder defaults. [NEW]

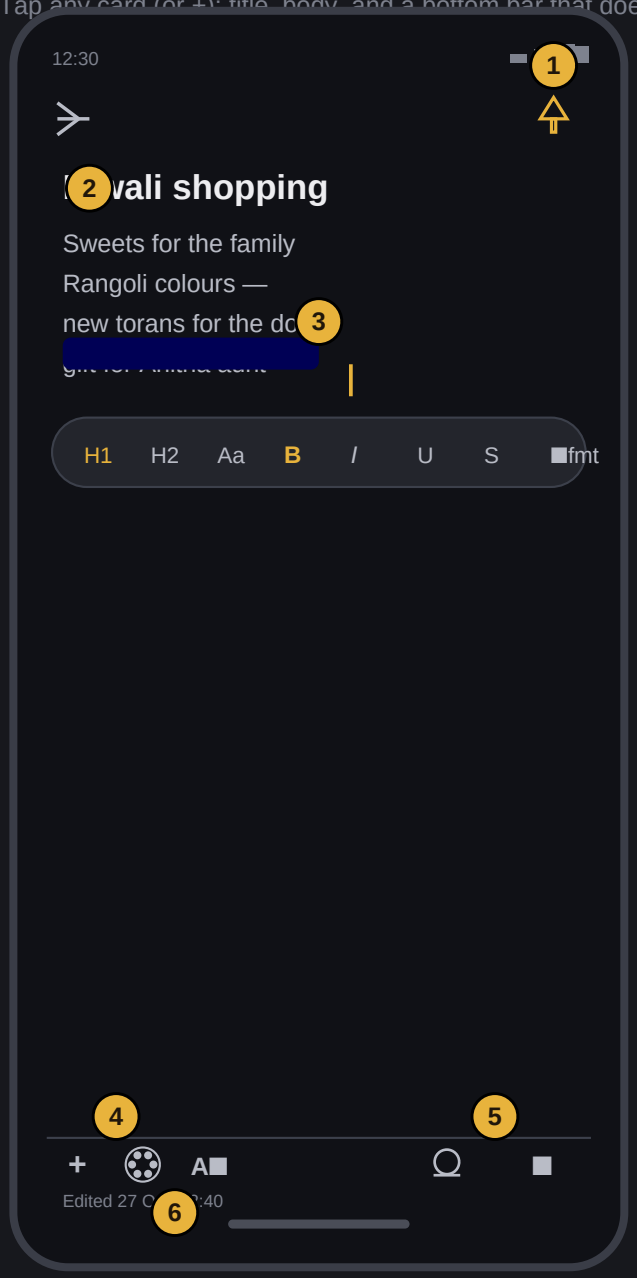

Trash & archive lifecycle — nothing is ever lost by accident

Undo snackbar follows every move: “Moved to trash · UNDO”. “Empty trash” asks once, then obeys.

Page 3 — The text editor & formatting

Tap any card (or +): title, body, and a bottom bar that does everything. Back = saved.

How it works, in simple words

1 **Pin at the top-right** — one tap pins this note to the top of the wall. [EXISTS]

2 **Title is optional** — no title? The first body line becomes the card's face. [EXISTS]

3 **Formatting toolbar (the underlined “A”)** — select text → H1/H2 headings, Bold, Italic, Underline, Strikethrough, clear-formatting. Keep got this in Oct 2023; cards render it too. [NEW]

4 **Markdown-style triggers** — type * or - then space: the line becomes a bullet. Type 1. then space: a numbered list starts itself. [NEW]

5 **Bottom bar** — + Add (image · drawing · audio), colour palette, format A, reminder bell, 3-dot (Delete · Make a copy · Send · Labels · Convert to checklist · Merge). [NEW]

6 **“Edited …” timestamp** — Indian-locale dates, subtle at the bottom; sorting can use it. [NEW]

7 **Autosave** — there is no Save button. Back, or tapping outside, saves. Empty note? It quietly disappears. [EXISTS]

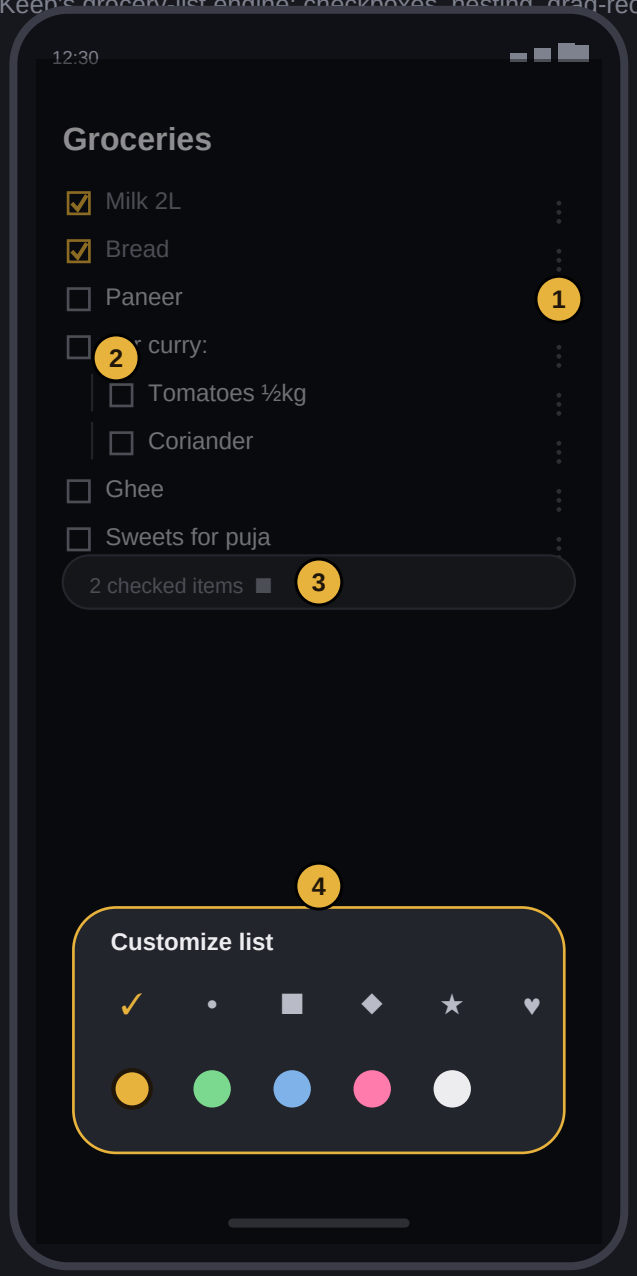

8 **Links are live** — a URL in the body opens on tap, copies on long-press. [NEW]

9 **Font size** — Settings chooses Small / Medium / Large for editor and cards alike. [NEW]

Undo snackbars follow delete/archive/colour changes — a wrong tap is never a lost note.

Page 4 — Checklist notes & list customization

Keep's grocery-list engine: checkboxes, nesting, drag-reorder, hidden checked items, custom bullets.

Every list behaviour, in simple words

1 **Drag-reorder** — the grip dots on the right: hold and slide any item to a new place. [NEW]

2 **Nested items** — indent any item to make it a sub-step (Keep's nested bullets); the guide line shows the family. [NEW]

3 **"N checked items" footer** — hide-checked collapses done items into one tappable row. The grocery list stays short. [NEW]

4 **Customize list** — Keep's 2024 feature, in OUR signature dark pill (never a stock dialog): pick the bullet glyph (✓ • ■ ◆ ★ ♥) and the theme colour; the card wears it too. [NEW]

5 **Enter adds the next checkbox** — the list grows as you type; a blank last line silently drops on save. [UPGRADE]

6 **Swipe a checked item** — flick a done item away; Undo snackbar if you change your mind. [NEW]

7 **Text ■ checklist** — 3-dot converts any text note's lines into checkboxes and back, losslessly (our lists are stored as plain text — search and export always work). [NEW]

8 **Links inside items** — a URL in a list item stays clickable. [UPGRADE]

Checkboxes tick instantly; Keep does not strikethrough by default — done items dim or hide, never cross out.

Page 5 — Five ways a note gets born

Keep's capture paths: FAB, quick actions, share-in from any app, and the home-screen widget.

1 · FAB + quick row

The keyboard is already up when the note opens — capture takes one tap.

Home, bottom-right:

+ note · list · drawing · camera · mic

one tap each; the editor opens already in that mode

2 · SHARE SHEET IN [NEW]

Chrome · article selected

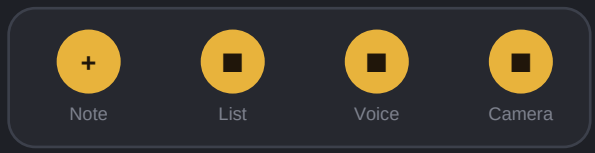

“Diwali sale ends Monday…” → Share

Share to

MySpace Notes · Messages · Gmail

text or images from ANY app land as a new note

3 · HOME-SCREEN WIDGET [NEW]

Keep's signature quick-capture widget: four doors, resizable, re-placeable (your standing widget rule).

Two more widgets live on page 14: single-note & list.

Why capture matters — the Keep lesson

★ Keep's own help text says it plainly: **“Quickly capture text, links, or images from any mobile app via the Share menu.”** The note app people keep is the one that is faster to feed than to forget. Everything above exists for speed: one tap from the wall, one tap from any other app, one tap from the home screen — and never a Save button anywhere.

! Share-target and widgets are **host-level** surfaces (they live in the MySpace / MyNotes app shell, not inside the notes engine) — so they arrive in the integration round without touching the feature module. That is the microservice rule keeping other apps safe.

Page 6 — Images, “grab image text”, and drawings

Photos become notes; their words become searchable; fingers and styluses draw.

Simple words

1 Photo notes — camera (no permission needed — the system camera app does the work) or the photo picker. Several images per note; the image IS the card; tap = full-screen viewer with swipe. [NEW]

2 Grab image text (OCR) — Keep's search superpower, done offline: bundled on-device text recognition copies the photo's words into the body, so search finds text you never typed. **[decision D2]** [NEW]

3 Drawing notes — finger or stylus; pen and highlighter strokes, five ink colours, widths, undo. Saved as the note's image; lives on the wall like any card. [NEW]

4 Our copies are ours — picked photos are copied into the app's private folder, so a note never breaks when the original moves or deletes (Keep leans on Drive; we lean on nobody). [NEW]

5 Voice lives here too — next page: recording, playback, and the honest word on transcription. [NEW]

Page 7 — Voice notes

Tap the mic: record, play, scrub. The card shows the audio chip. One honest caveat inside.

Simple words — and one honest caveat

1 **Playback** — play/pause, slide to scrub, position shown; recordings live in the app's private folder (the Recorder app's proven pattern). [NEW]

2 **Recording** — live waveform and timer; Cancel or Stop. Needs the RECORD_AUDIO permission — the one permission Notes would declare. **[decision D1]** [NEW]

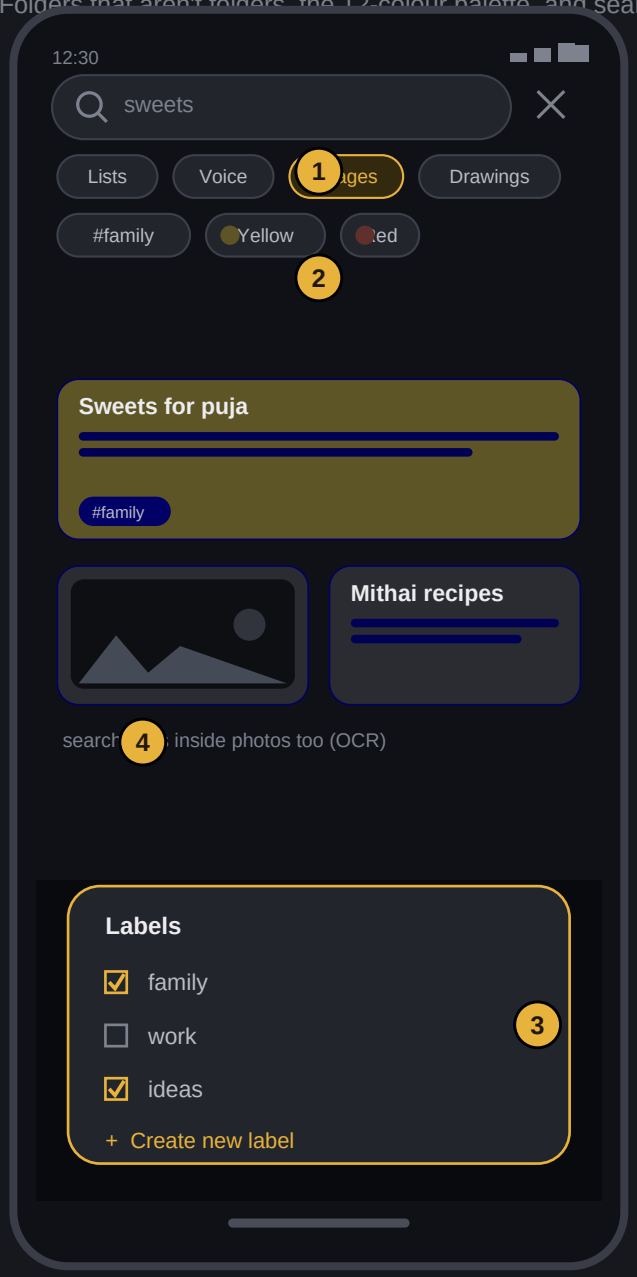

3 **Audio chip on the card** — ■ + length, visible on the wall without opening. [NEW]

4 **Transcription — the honest caveat** — Keep auto-transcribes voice using Google's cloud. We are offline-first: good on-device speech models are heavy and weak, so **we propose to defer auto-transcription [decision D3]** and ship record + play + manual text now. If you want it later, we revisit with real on-device ML — no cloud, no account. [NEW]

5 **Search still finds voice notes** — by title, labels, colour and the “Voice” type filter, transcript or not. [NEW]

Page 8 — Labels, colours, and search filters

Folders that aren't folders, the 12-colour palette, and search that narrows by type/colour/label.

Simple words

1 Type filters — Lists · Voice · Images · Drawings: one tap narrows results to that note type (Keep's documented filter set). [NEW]

2 Colour & label filters — narrow by background colour or by #label; filters stack (yellow + #family). [NEW]

3 Labels dialog — checkboxes, many labels per note, “Create new label” inline. Typing # in a note body offers labels as you type and creates new ones on the fly. [NEW]

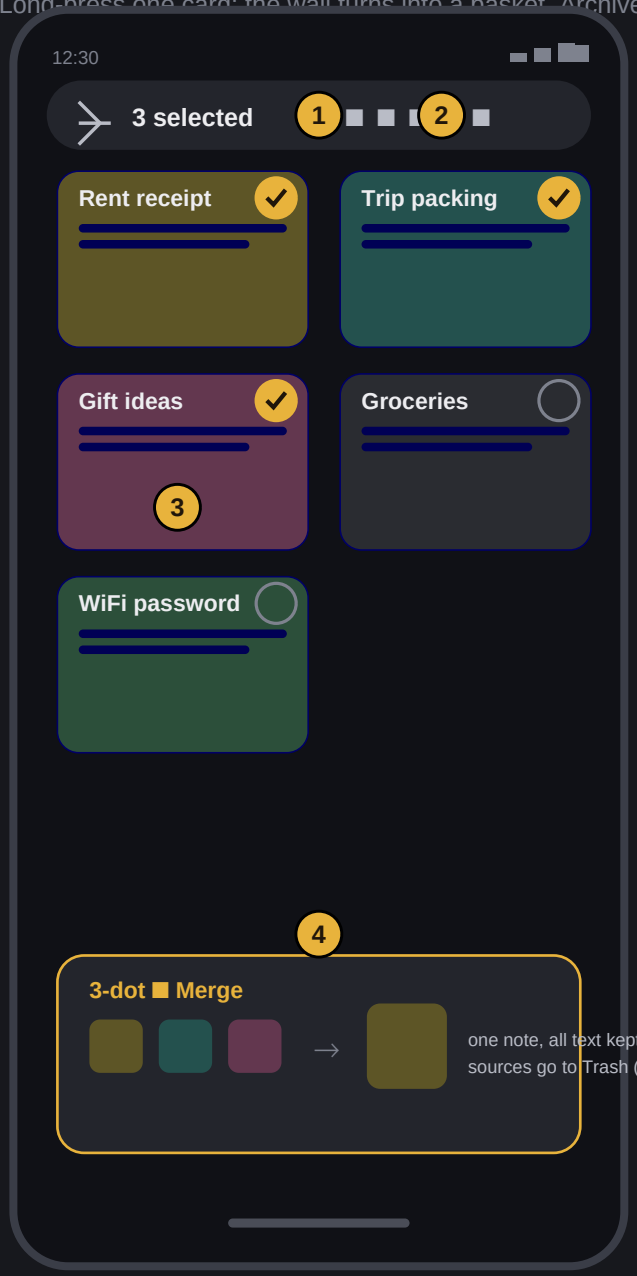

4 Search sees what you never typed — OCR'd photo words (page 6) are indexed like text: “sweets” finds the picture of the sweet box. [NEW]

5 Instant, never laggy — filtering runs off the UI thread and updates cards in place; a contract fails the build if typing ever rebuilds the wall (your old submit-search order stays honoured in spirit: no lag). **[decision D5]** [UPGRADE]

6 Label pages — every label is also a page in the drawer: its own wall, its own search. [NEW]

Page 9 — Multi-select & bulk actions

Long-press one card: the wall turns into a basket. Archive, delete, label, colour, share, merge — in one move.

Simple words

1 Long-press a card — selection mode: cards grow a gold check circle; tap more cards to add; ✕ or Back exits. [NEW]

2 The action bar swaps — “3 selected” replaces the title; icons: copy/send · label · colour · share · 3-dot (archive, delete, merge). [NEW]

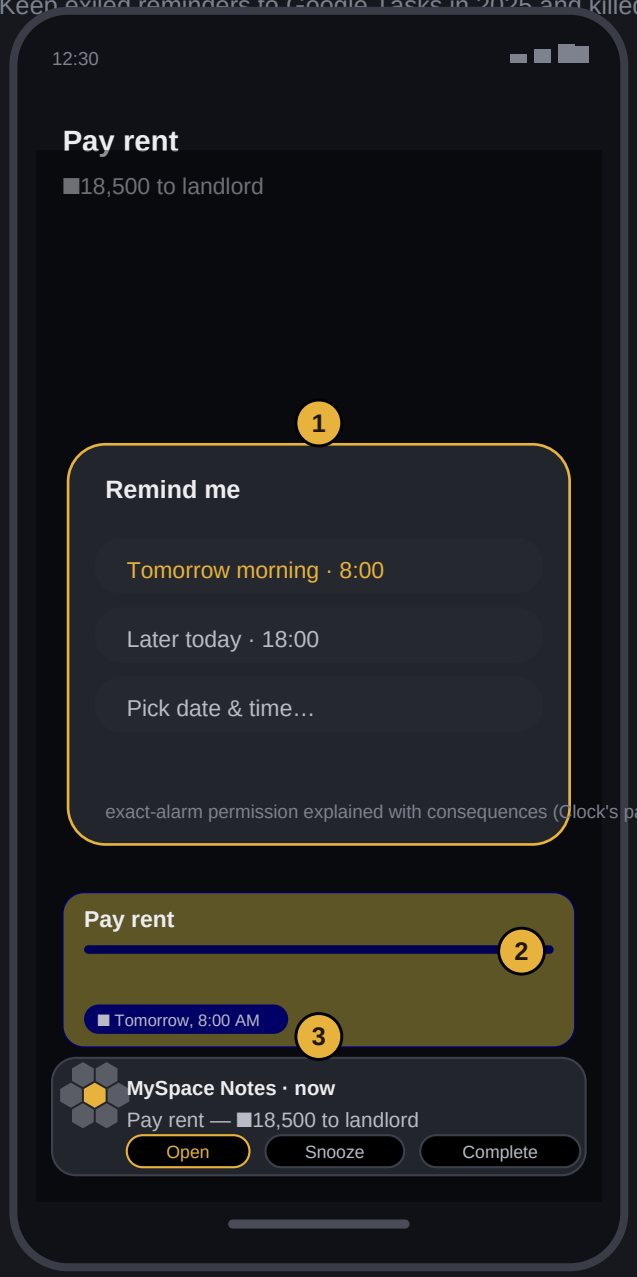

3 Bulk everything — archive 20 notes, trash 5, label 3 as #work, recolour the wall — each in one tap, each with ONE Undo snackbar for the batch. [NEW]

4 Merge — combines selected notes into one (titles become first lines) and opens it for editing; the sources go to Trash, restorable for 7 days. [NEW]

5 Bulk share — selected notes concatenated into one share payload; photo notes attach their images. [NEW]

Page 10 — Reminders, natively ours

Keep exiled reminders to Google Tasks in 2025 and killed location reminders. Ours stay inside the app — no account, offline, alive after reboot.

Simple words

1 Bell → sheet — Keep's quick picks (Tomorrow morning · Later today · Pick date & time) in our dark-pill design. A saved reminder shows as a chip under the note and on its card. **[NEW]**

2 Reminder chips — "■ Tomorrow, 8:00 AM" on the wall: what is due, without opening anything. The Reminders drawer page lists them all, soonest first. **[NEW]**

3 The notification works — Open · Snooze (+10 min / +1 h / tomorrow) · Complete. Survives reboot (the Clock's re-arm receiver pattern, reused not reinvented). **[NEW]**

4 Why this beats Keep now — Google moved Keep's time reminders into the Tasks app (late 2025) and discontinued location reminders entirely. Ours never leave the phone: no account, no migration, no surprise. **[NEW]**

5 Every ring is logged — set, fired, snoozed, completed: outcomes in the transcript, like everything else we build. **[NEW]**

Page 11 — Safety: Undo, Trash, and the 7-day window

The whole promise in one picture: a wrong tap is never a lost note.

Undo snackbar — after EVERY quiet action

“Moved to trash · UNDO”

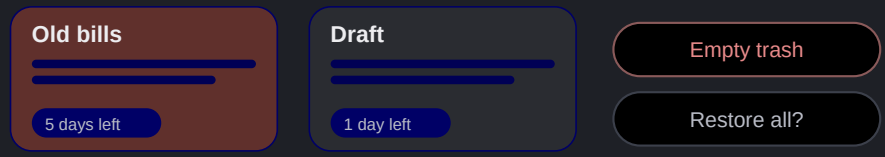

“3 notes labelled #work · UNDO”

“Colour changed · UNDO”

“Notes merged · UNDO”

Keep replaced confirm-dialogs with undo. So do we — the current “Delete this note?” dialog retires. [D8]

Trash page — the 7-day window

each card: 3-dot ■ Restore / Delete forever

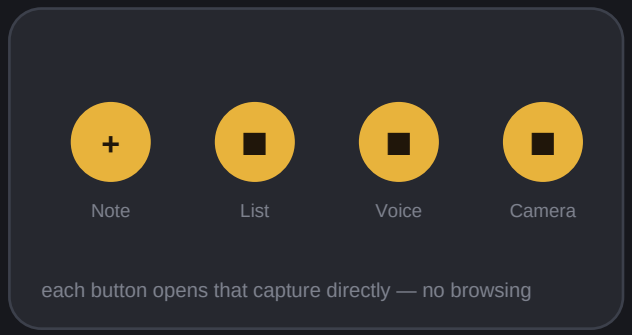

day 8: auto-purge, checked every time the app opens — no server needed, the phone keeps its own calendar

Keep Help says 7 days; some 2025 web reports say 30 — we pin 7 in ONE constant; it can move in a line. [D4]

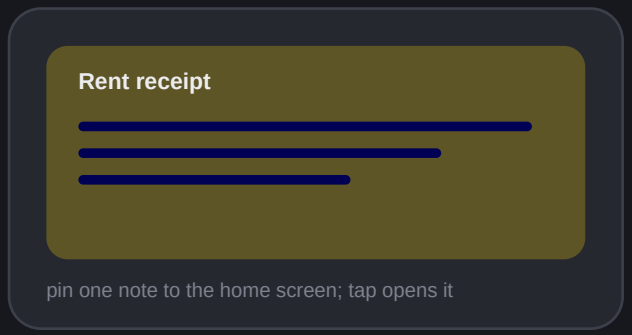

★ **The safety stack, bottom to top:** Undo snackbar (instant regret) → Trash 7-day window (slow regret) → Archive forever (not regret, just tidying) → the JSON mirror + export bundle (a note outlives even the app). Four nets under every note — this is exactly Keep's model, plus our offline export.

Page 12 — Widgets: Notes on the home screen

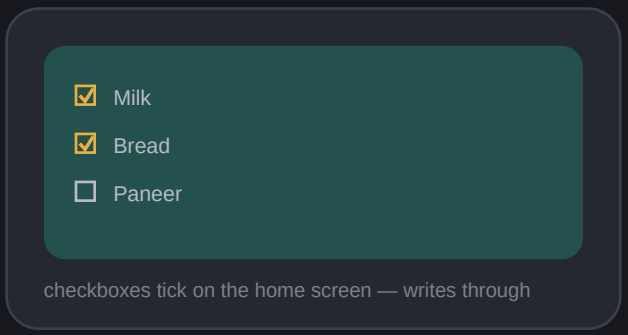

Keep's three widgets, rendered by the suite's existing widget engine — resizable, re-placeable, re-configurable.

QUICK CAPTURE — 4 DOORS

SINGLE NOTE — LIVE CONTENT

CHECKLIST — TICK FROM HOME

1 **Rendered by the suite's widget engine** — the same one the Clock's 20 providers use: resize-aware (150×84dp minimum hints), re-placeable, launcher long-press ■ Configure re-enters Widget Studio for that instance. [NEW]

2 **Host-level, integration round** — widgets live in the app shell, not inside the notes engine, so developing them cannot touch Notes' internals or any other app (the microservice rule again). [NEW]

3 **Live content** — single-note and list widgets show REAL current content, and a tick on the home screen updates the note instantly. [NEW]

Page 13 — The design language

Keep's 2025 look as the reference; OUR signature as the skin. Every rule below was paid for in the calculator rounds.

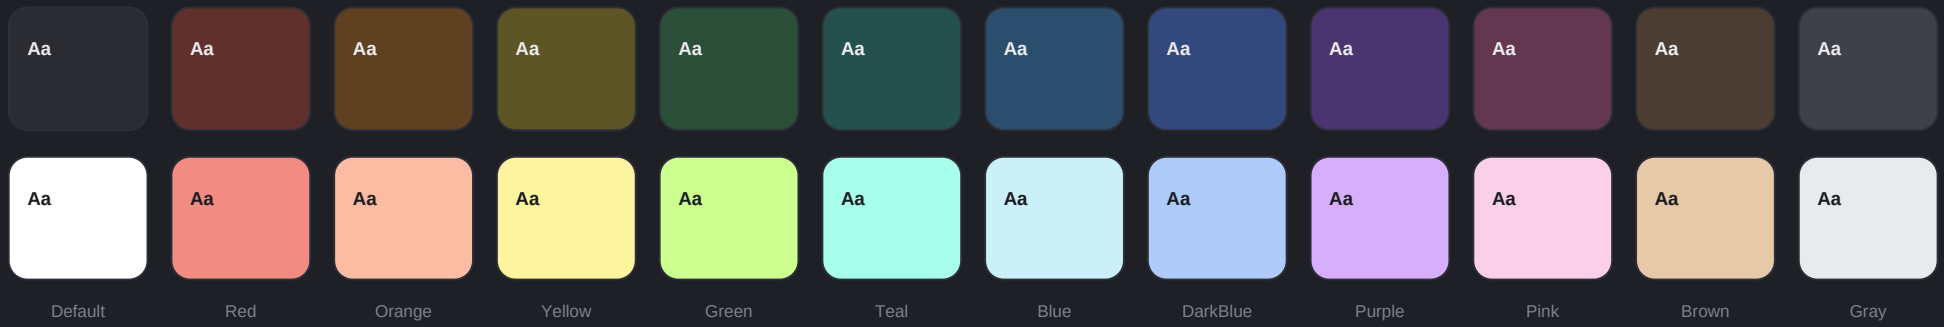

Our signature (non-negotiable, owner-set)

- Dark-pill popups everywhere — a stock AlertDialog was rejected on sight in the calculator (“outdated… match the app's design”).
- Glass surfaces + GelMotion press feels; every click animates.
- Honeycomb mark forever — icon, header, widgets, notifications.
- Contrast guard: ink vs fill within 0.35 luminance → auto-swapped near-black/near-white. A colour cannot ship unreadable text.
- True dark mode: exact-dark, not gray; no white flashes.

Keep's Material 3 Expressive (the reference)

- Bolder typography, expressive shapes and buttons (Aug 2025).
- Springy motion: cards expand from their position into the editor, staggered entrance on the wall, FAB morph, snackbar slides.
- 12 flat note colours, rounded 8dp cards, generous whitespace.
- Chips as the universal language: reminders, labels, filters.

The 12 colours, both themes — every pairing contrast-guarded

top row: dark theme · bottom row: light theme · the calculator's LED lesson applied from day one: readable in BOTH, always

Page 14 — The plan, the promises, and your 8 decisions

How we build without touching anything that works — and what needs your word before Phase 0.

Five phases

P0 — Skeleton
standalone MyNotes host
isolation contracts
logging · stamp

P1 — Keep's core loop
wall · drawer pages · trash
editor chrome · colours
bulk · undo

P2 — Lists & text power
formatting
checklists full set
customize-list · merge
share

P3 — Media
photos · OCR · drawing
voice (transcription deferred)

P4 — Reminders & search
native reminders
instant search + filters
labels · sort
drag-order last

P5 — Integration
into MySpace: registry swap
share target · widgets
full regression of ALL apps

The microservice promises

Notes imports only :core-* — pinned by gate contracts both ways.

MySpace's APK does not change until the ONE integration round.

The calculator stays FROZEN; its 59 stories keep running as proof.

Development + your testing happen on a standalone MyNotes APK
(the MyCalc pattern: perfect it alone, then bring it home).

The testing promises (calculator lessons pre-paid)

Every feature gets an end-user story, not a widget test.

“Visible” means pixels counted on a bitmap — never “intended”.

Logs record OUTCOMES from day one; the transcript rides out of CI.

Gestures dispatch through views (the farm playbook, pre-applied).

Two red runs max before instrumenting — no rerun loops. Ever.

Your 8 decisions — answer these (or say “proposals accepted”) and Phase 0 starts

D1 RECORD_AUDIO permission for voice notes
→ **propose: declare it (Recorder precedent)**

D2 On-device OCR (bundled ML Kit, offline, a few MB)
→ **propose: yes — size is not a constraint**

D3 Offline auto-transcription of voice
→ **propose: defer — record+play ships now**

D4 Trash window: Keep Help says 7 days, some reports 30
→ **propose: pin 7, one constant**

D5 Instant search vs your old submit-search order
→ **propose: instant, off-thread, no-lag contract**

D6 Drag-and-drop note reordering on the wall
→ **propose: ship, but LAST (riskiest gesture)**

D7 Standalone MyNotes APK during development
→ **propose: yes — the MyCalc pattern**

D8 Delete-confirm dialog → trash + Undo snackbar
→ **propose: adopt Keep's model**
