Paper & Ink

MyNotes 0.9.0 (10) - a content-first redesign, with practical evidence instead of a mockup-only promise.

One writing surface. Optional title. Native caret and selection.

Less interface. More note.

Warm paper and charcoal ink; honey accents only where they help. A shared visual language across the editor, cards, diagrams and settings.

Context, not a button wall.
Capture, formatting, organisation and note actions appear when needed. Existing capabilities stay available.

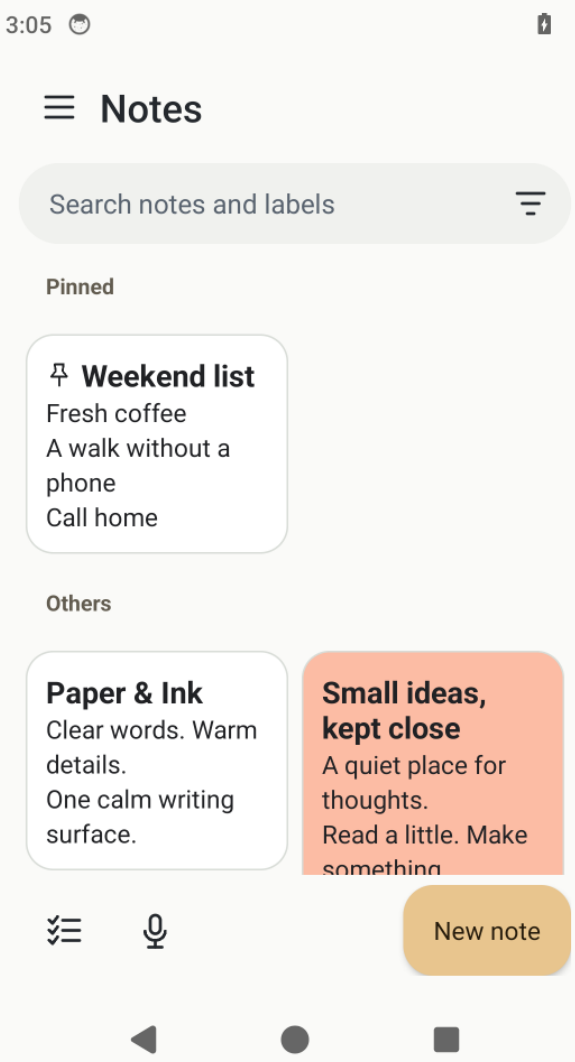

Paragraphs must behave like paragraphs.
H1/H2 remeasure the native text layout. Following lines move naturally; composing a word and pressing Enter are tested.

Evidence boundary
These are real emulator screen captures from synthetic fixtures, not photographs of a physical phone and not signed-release UI captures. Signed APK identity/update checks are separate. Green case counts do not automatically approve the look or first-use experience.

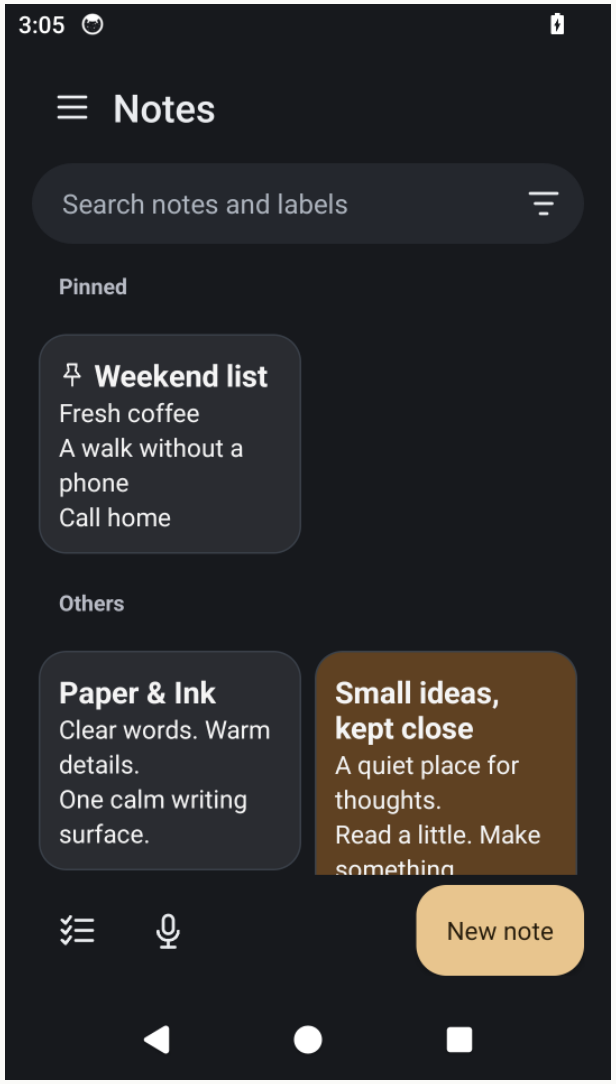

The old 0.8 functional build was published, but the user rejected its UI. This review replaces that acceptance claim; final device/user experience is still decisive.

Your notes, not a control panel

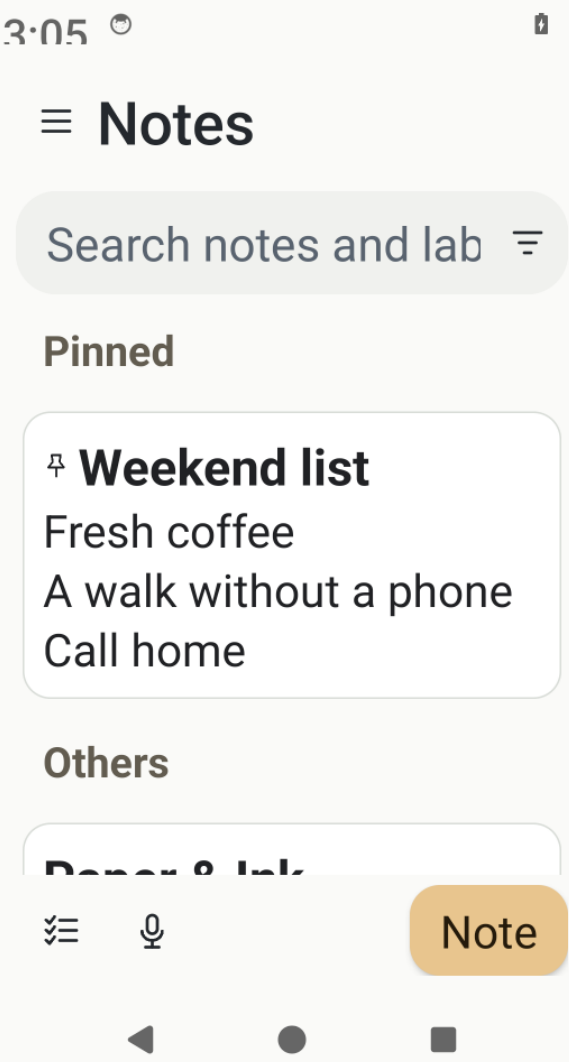

Quiet cards, off-thread search and clear creation actions. Card columns adapt to width and large text.

Dark

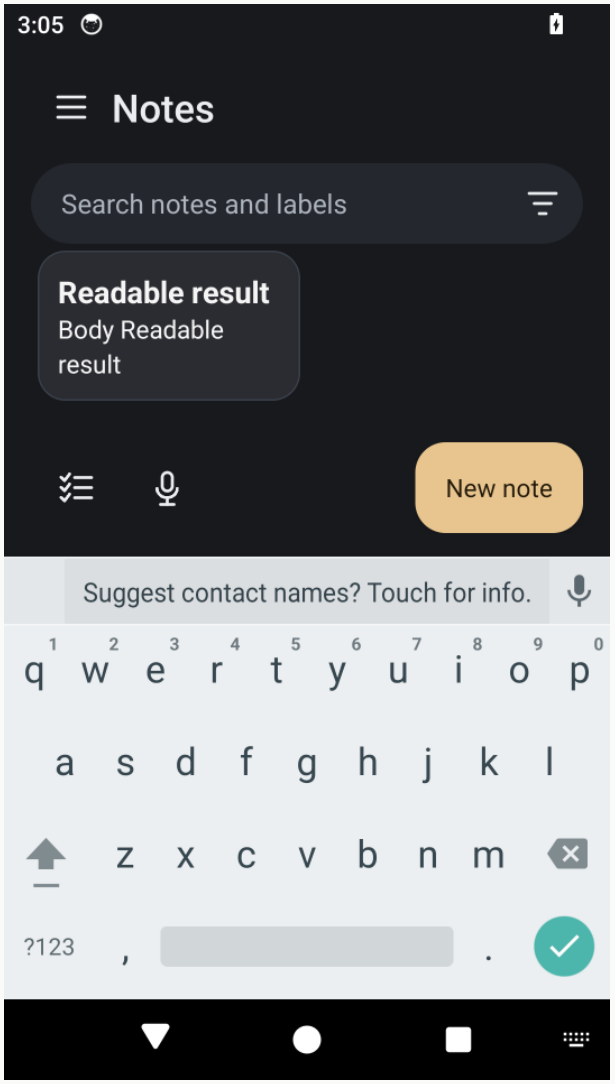

200% system font

Search should leave room for results

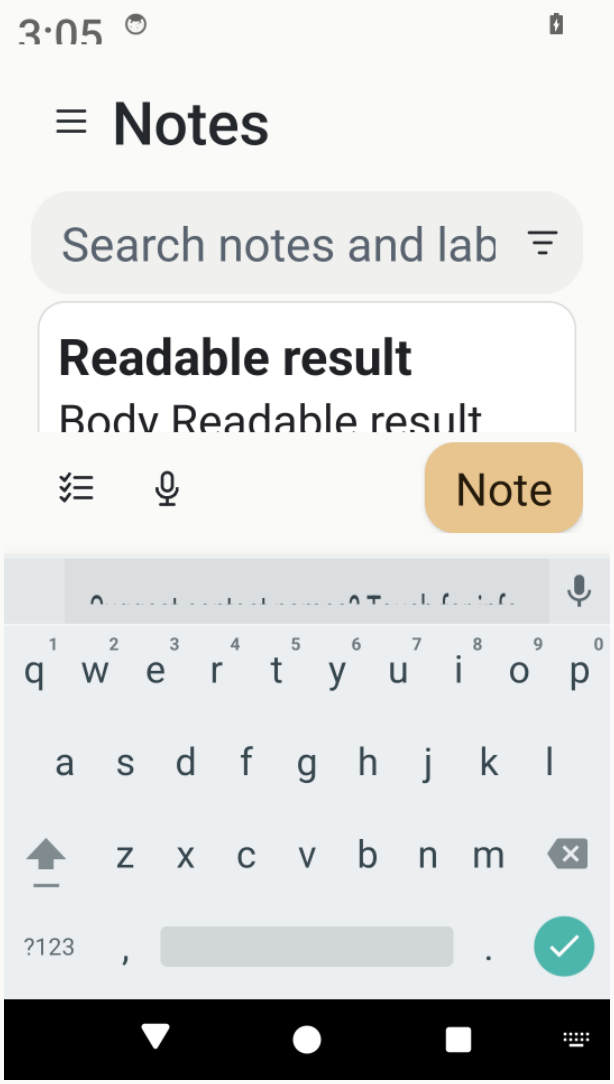

In cramped landscape, non-search chrome collapses. A native test requires a readable result title above the keyboard.

Light

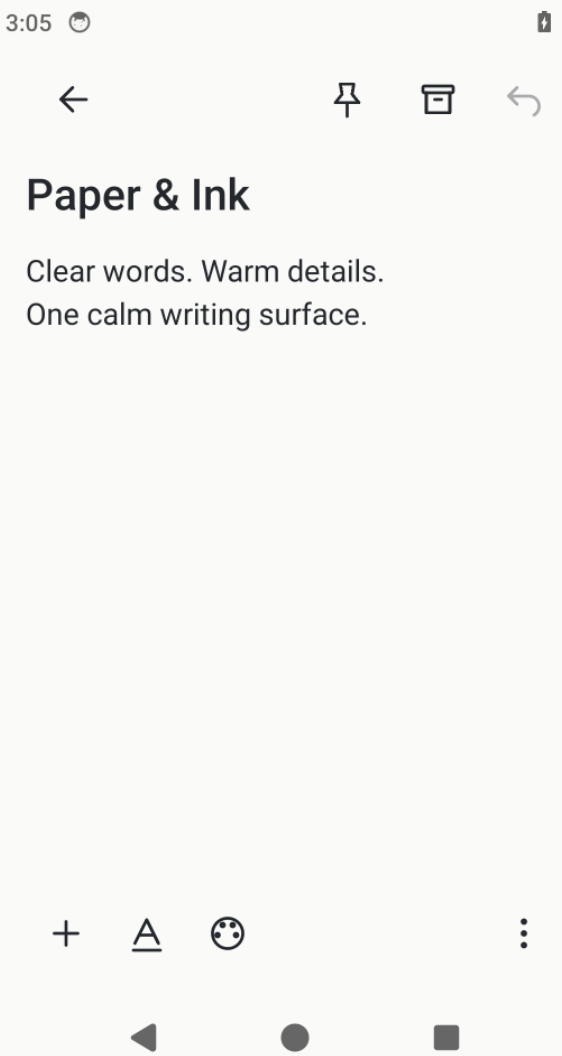

Dark

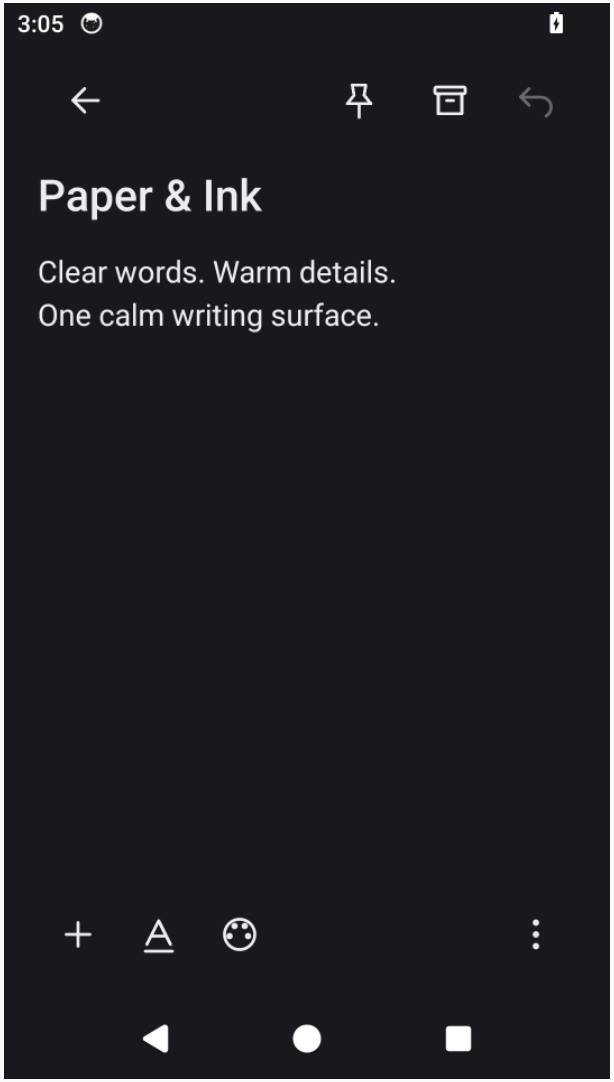

200% system font

A calm place to write

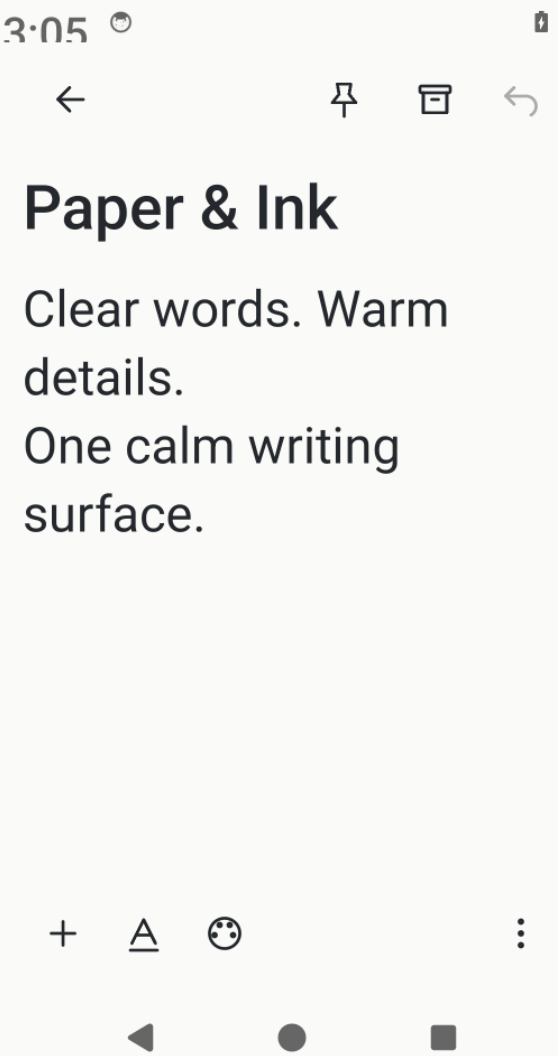

Optional title, direct body editing, restrained top and bottom chrome; no permanent command stack.

Light

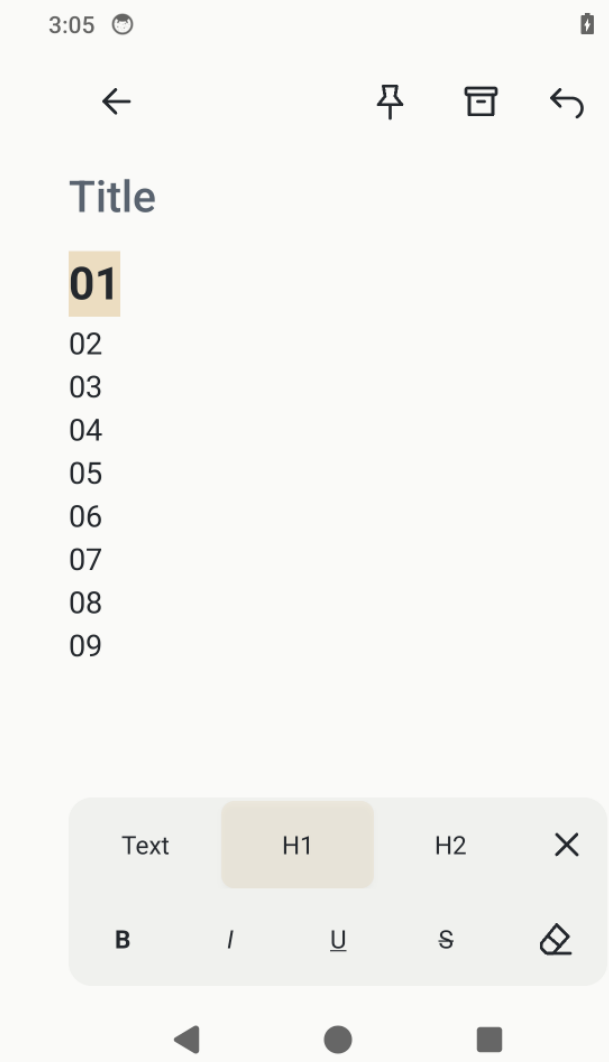

Dark

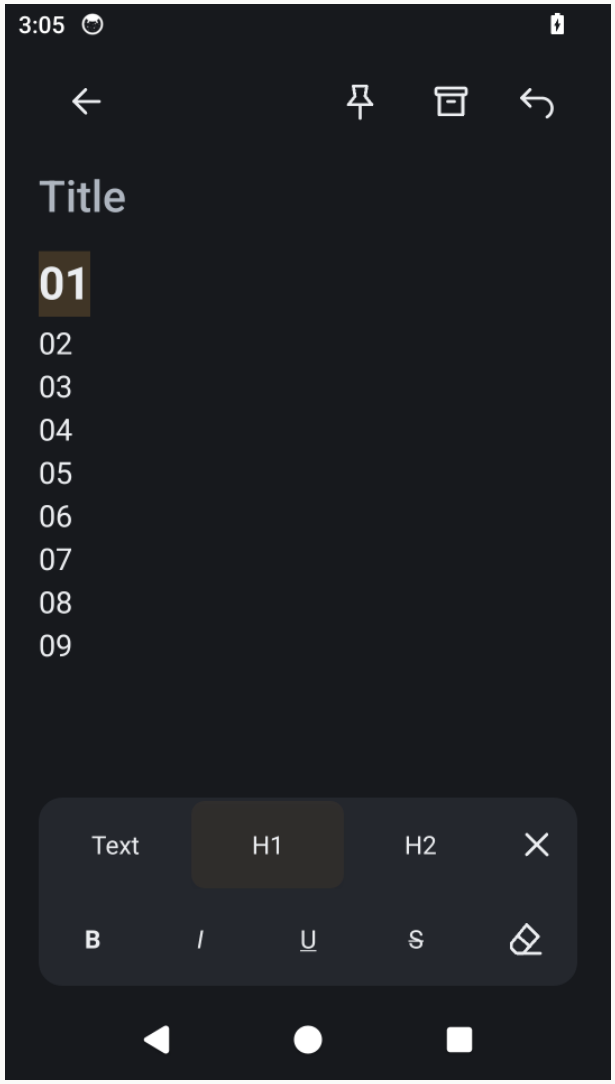

200% system font

The reported case: H1 on 01

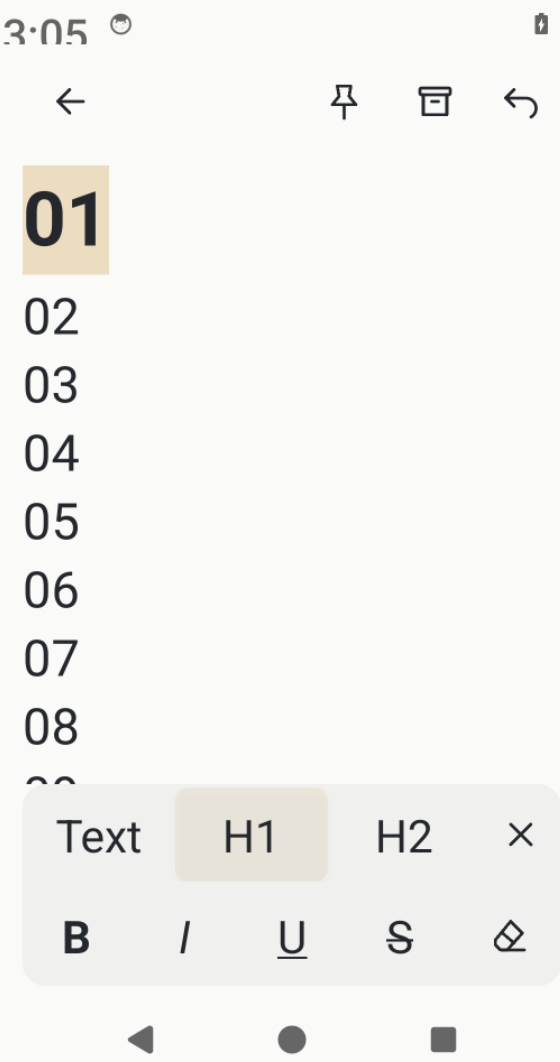

01 is a heading; 02-09 remain ordinary paragraphs. Images precede the diagnostic raster colour mutation.

Light

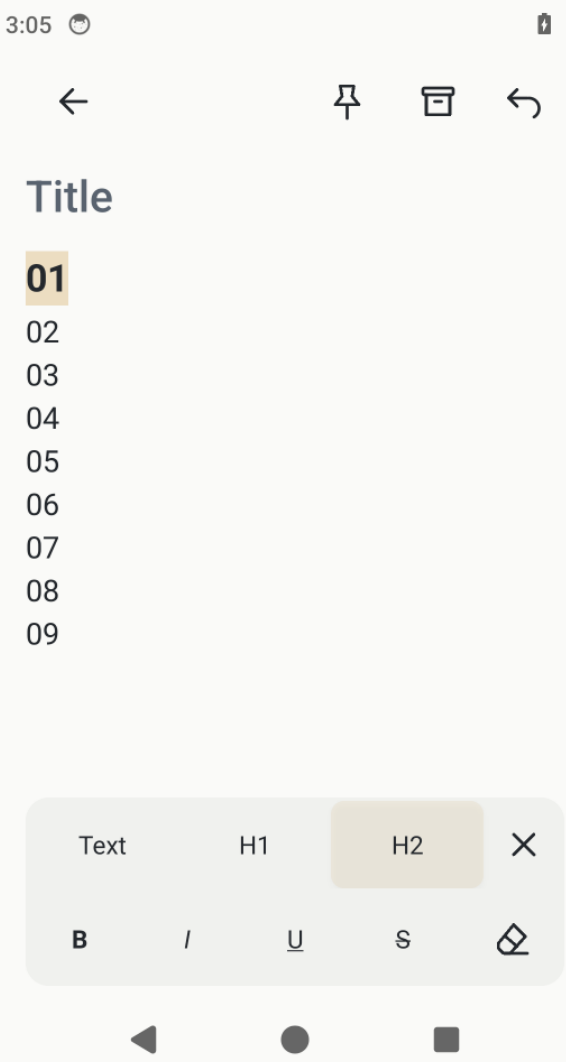

Dark

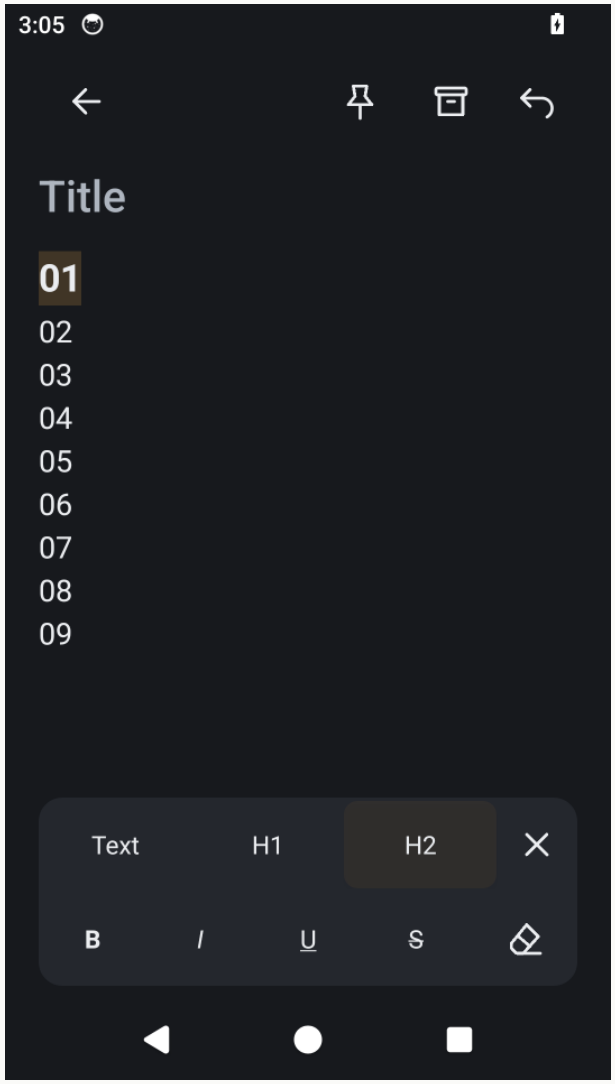

200% system font

The reported case: H2 on 01

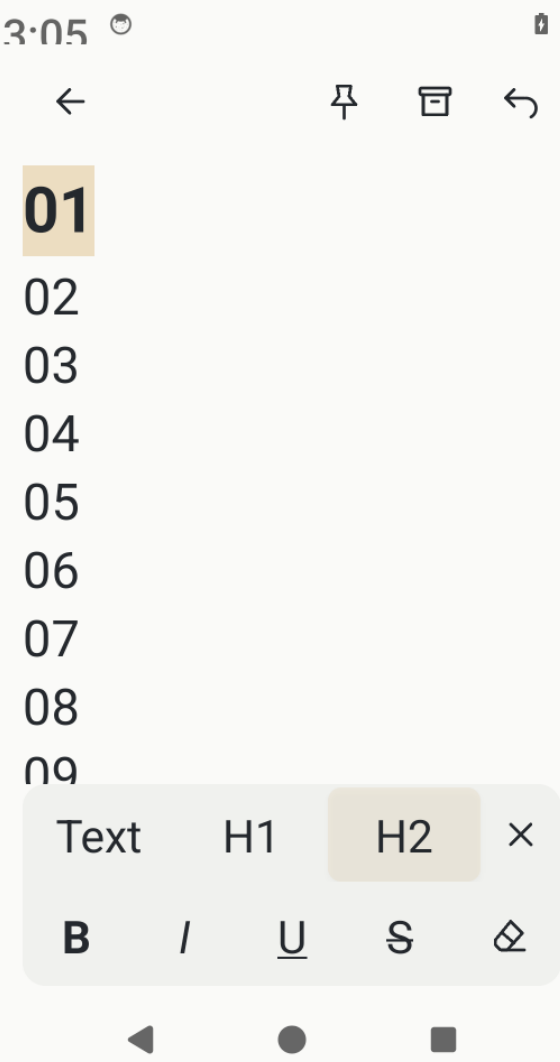

Changing heading size should reflow the paragraph, not paint larger letters over the next line.

Light

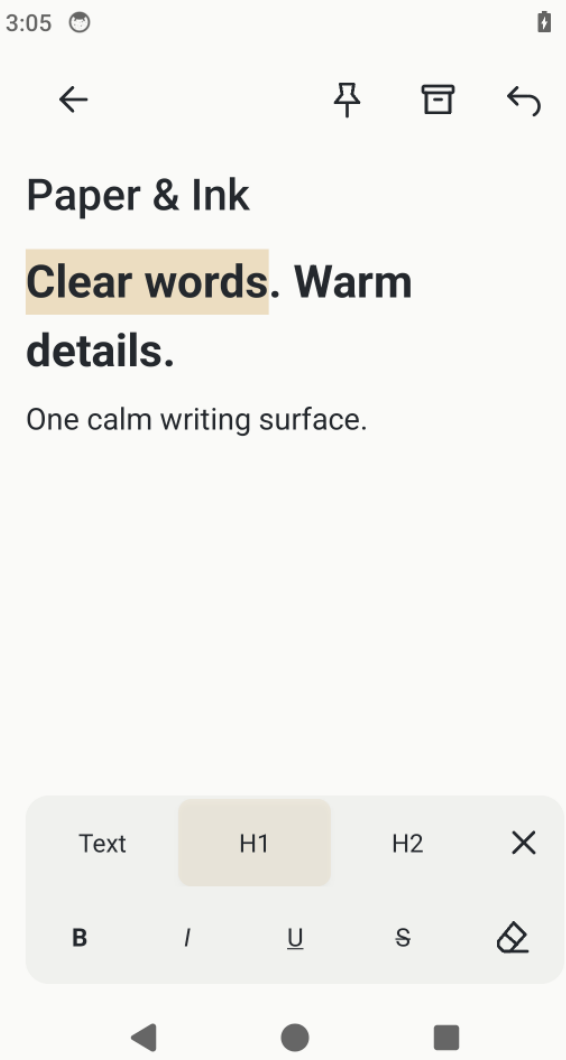

Dark

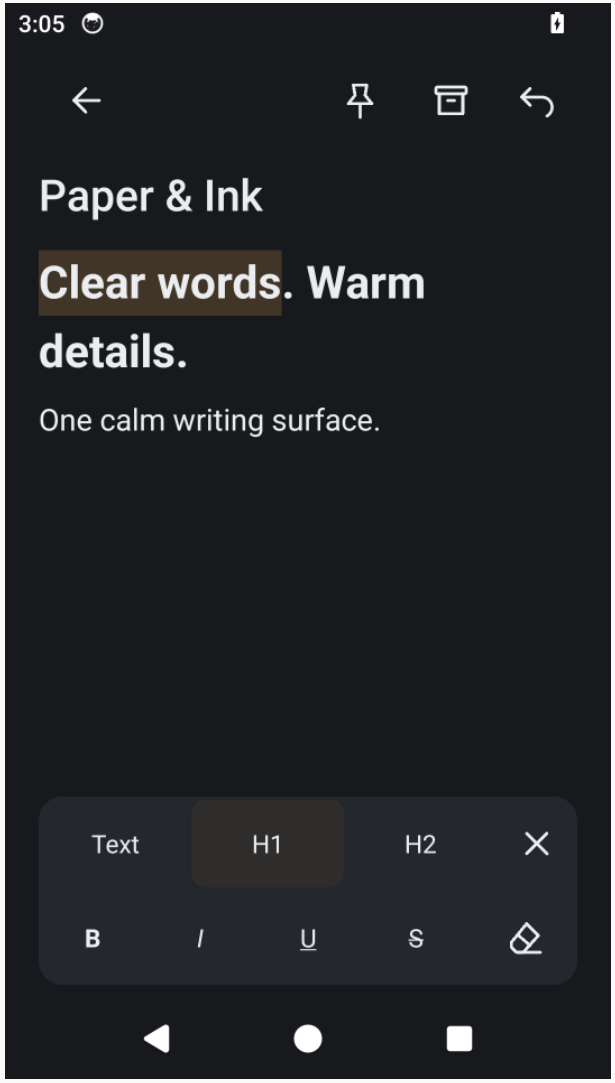

200% system font

Formatting stays contextual

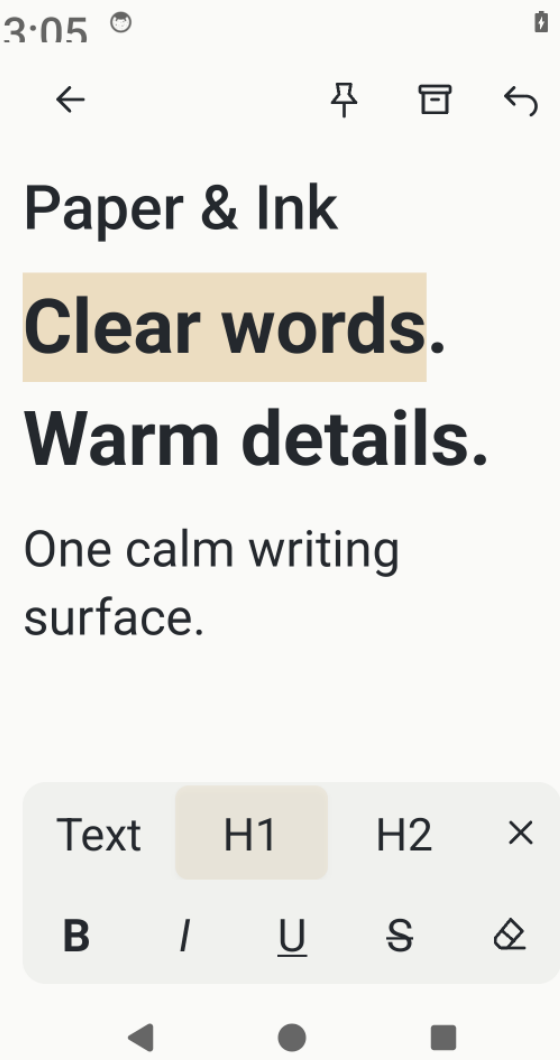

Text / H1 / H2 describe paragraphs; B / I / U / strike apply inline. The formatting deck replaces the normal dock.

Light

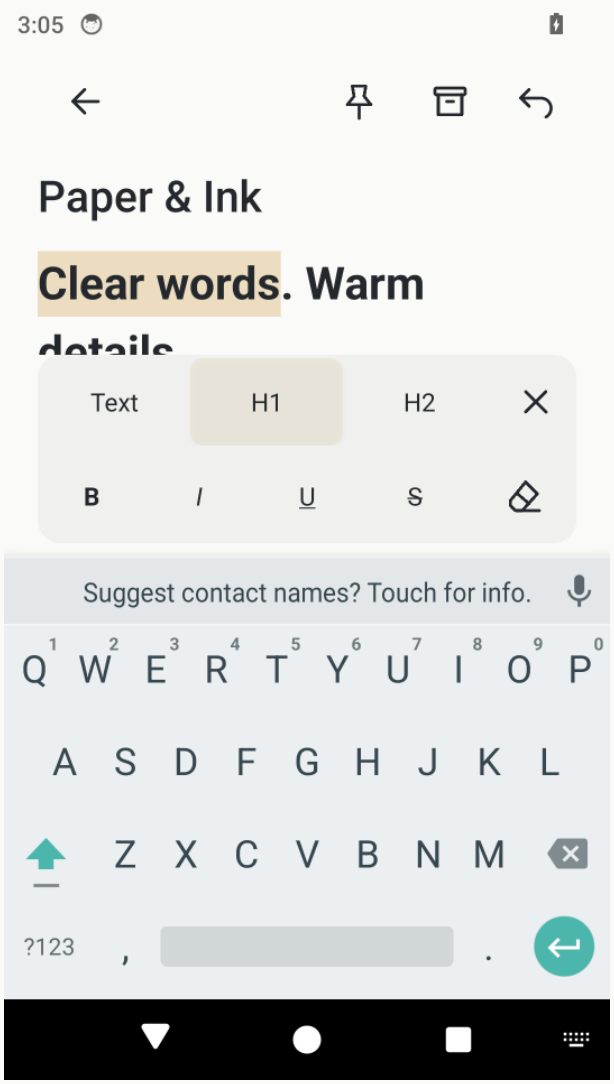

Dark

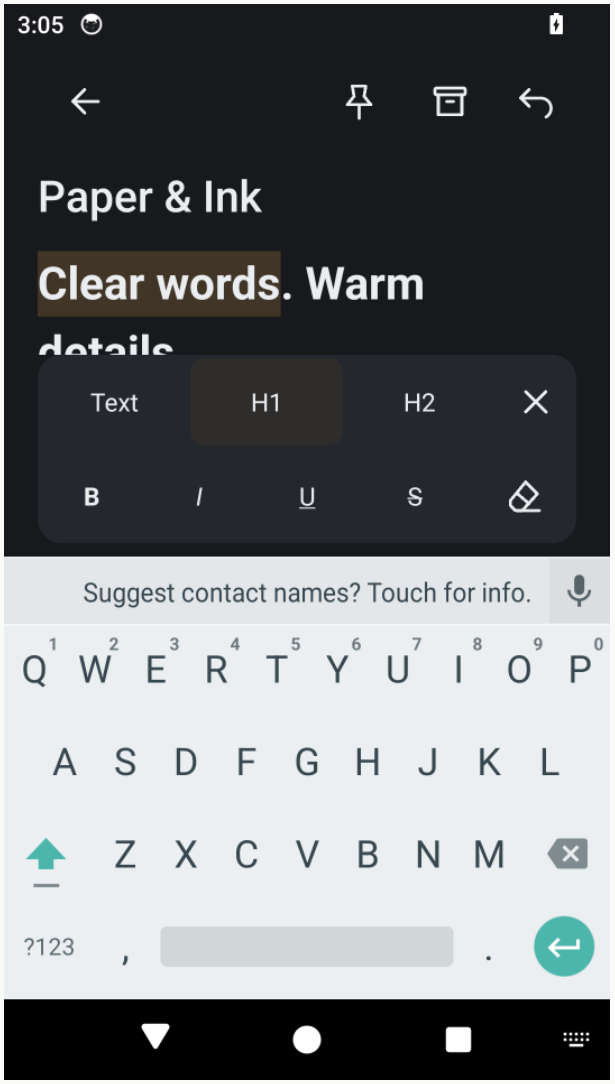

200% system font

Keep writing with the keyboard

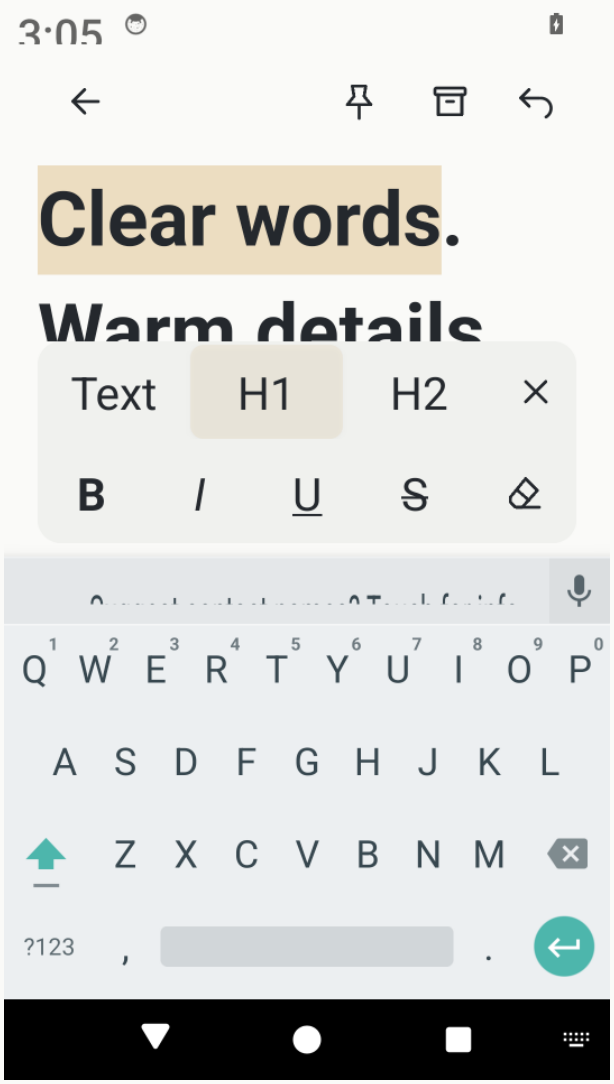

Where there is room, formatting stays above the keyboard. Cramped landscape restores writing space rather than hiding the note.

Light

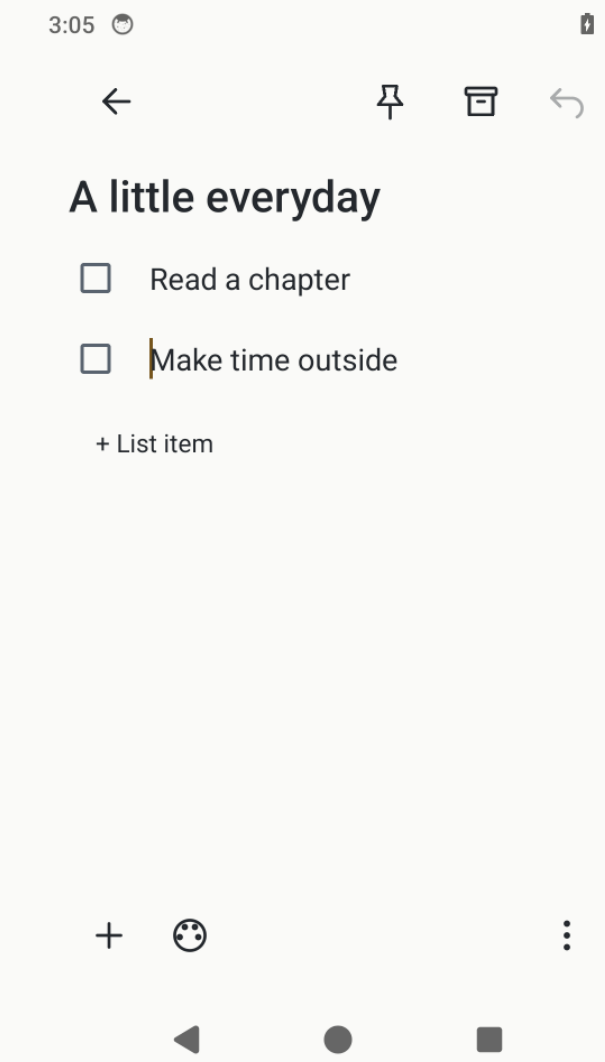

Dark

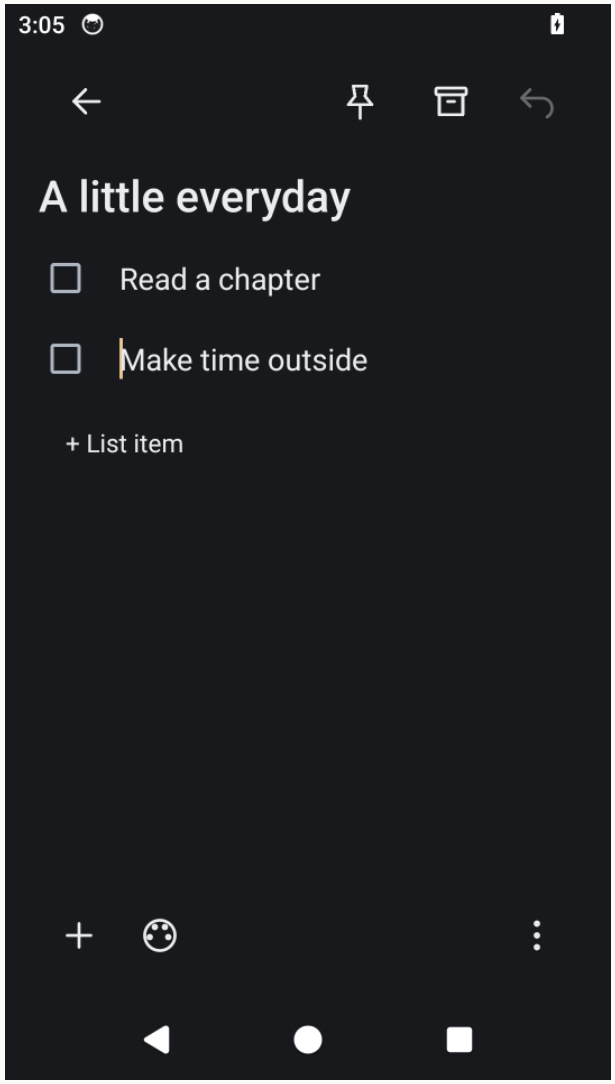

200% system font

Lists that stay readable

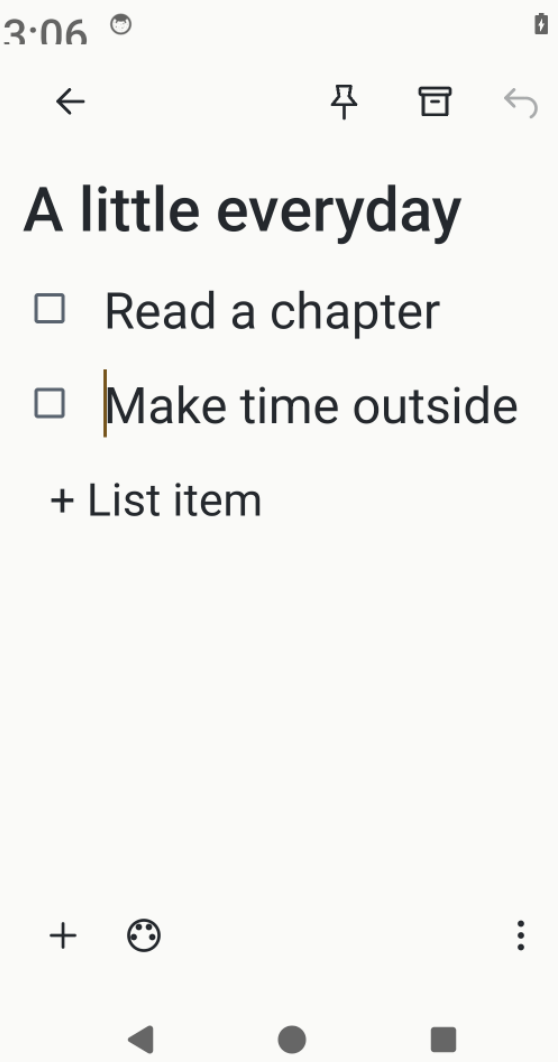

Native editable list items, large checkbox targets and a simple Add item route. No empty progress counter.

Light

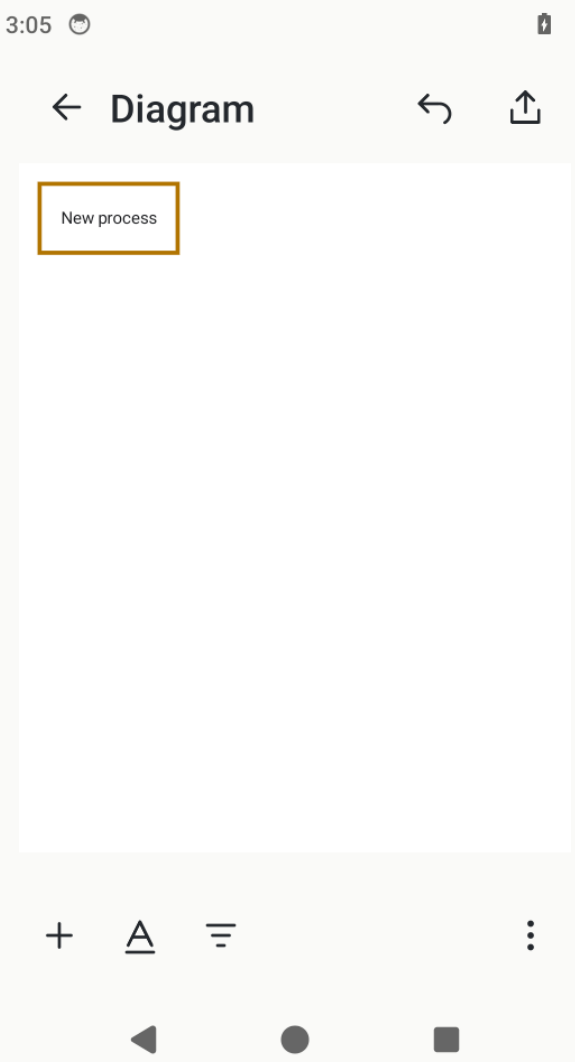

Dark

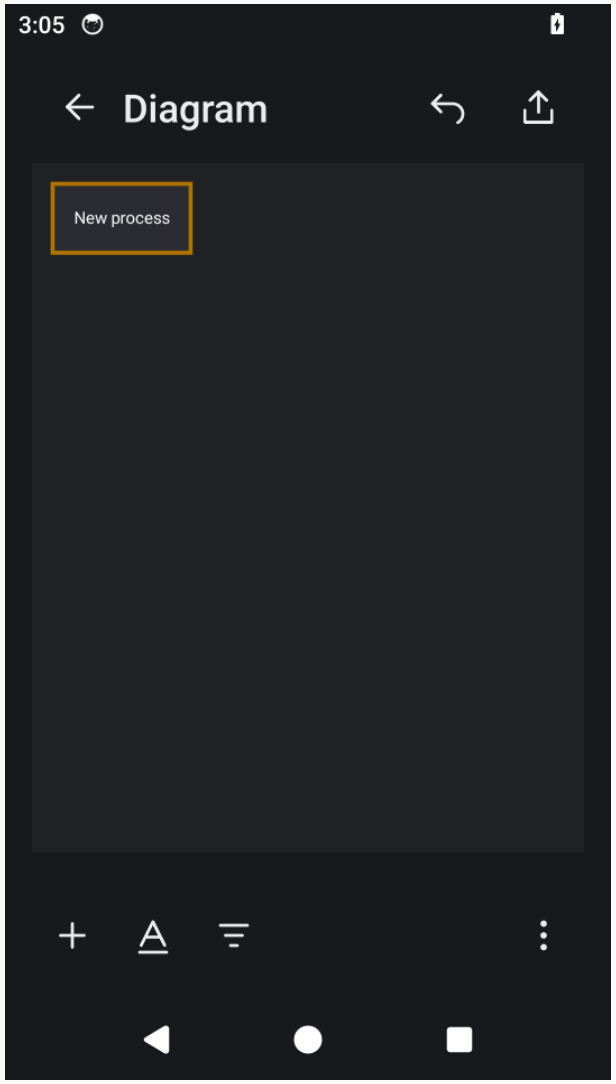

200% system font

Diagrams share the same language

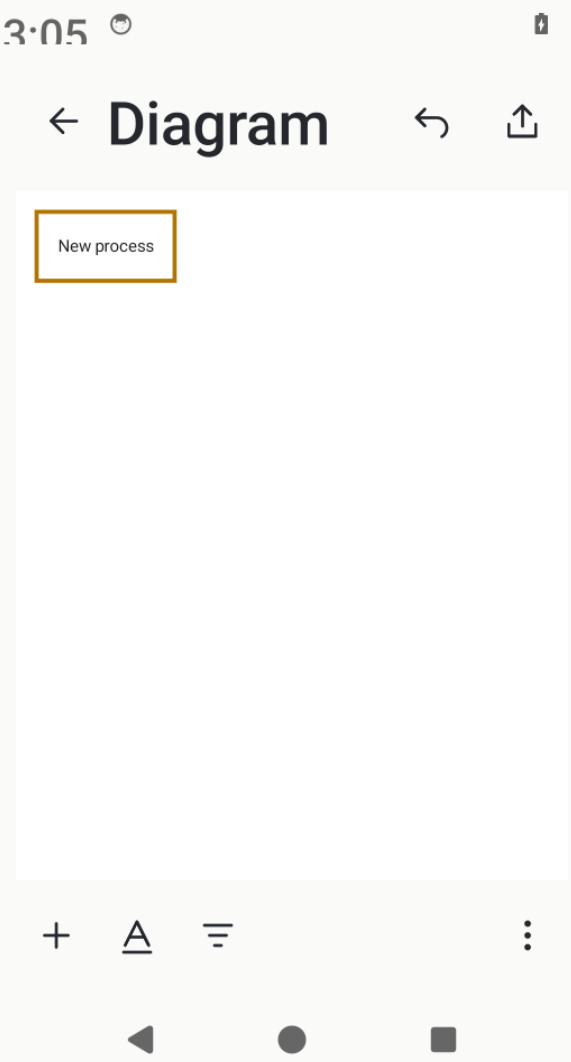

A focused canvas with contextual Add, text/style, arrangement and More tools. Editable objects are retained.

Light

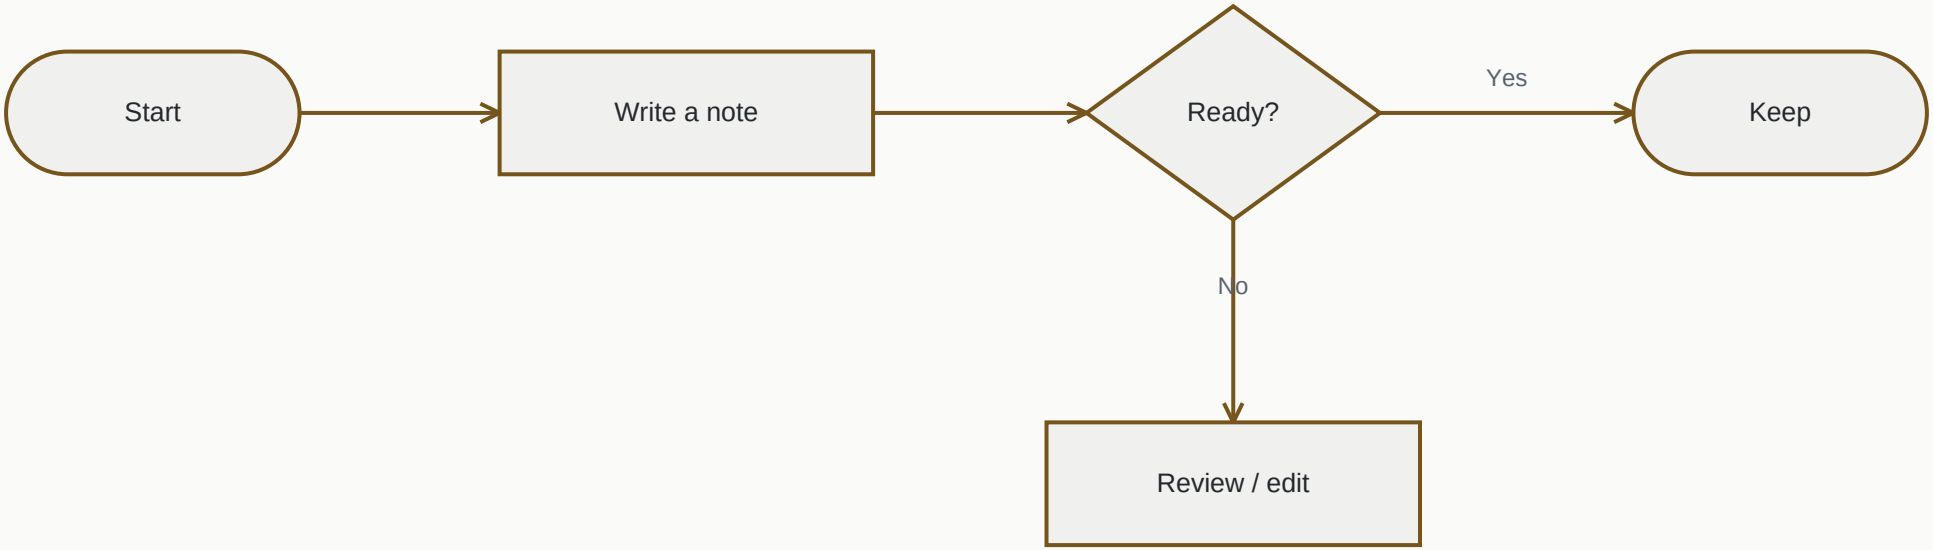

Dark

200% system font

A simple flowchart, still editable

Schematic guide to the six current shape types and directed labelled arrows. This page is explanatory, not an emulator capture.

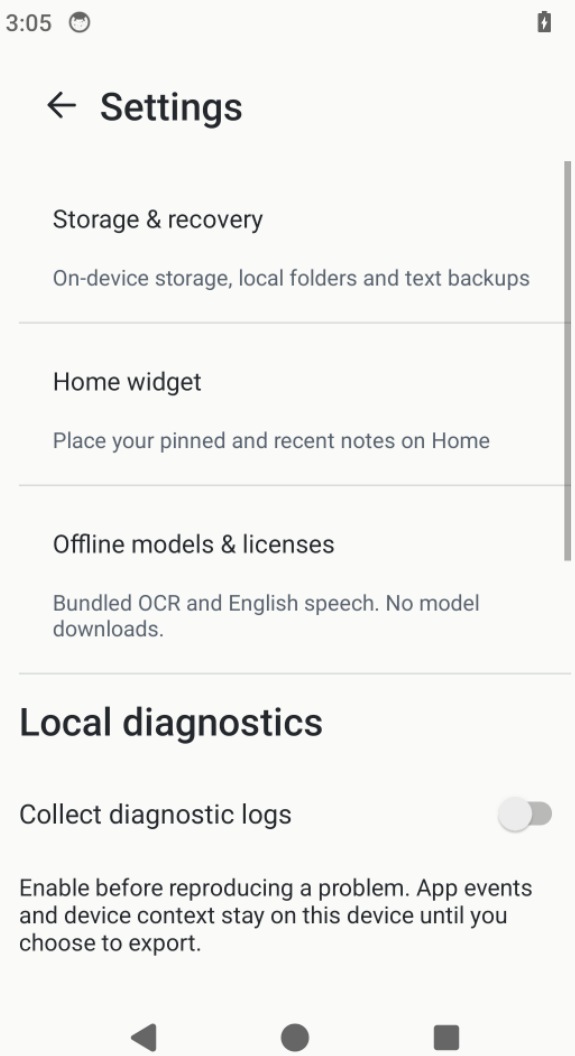

Other current building blocks

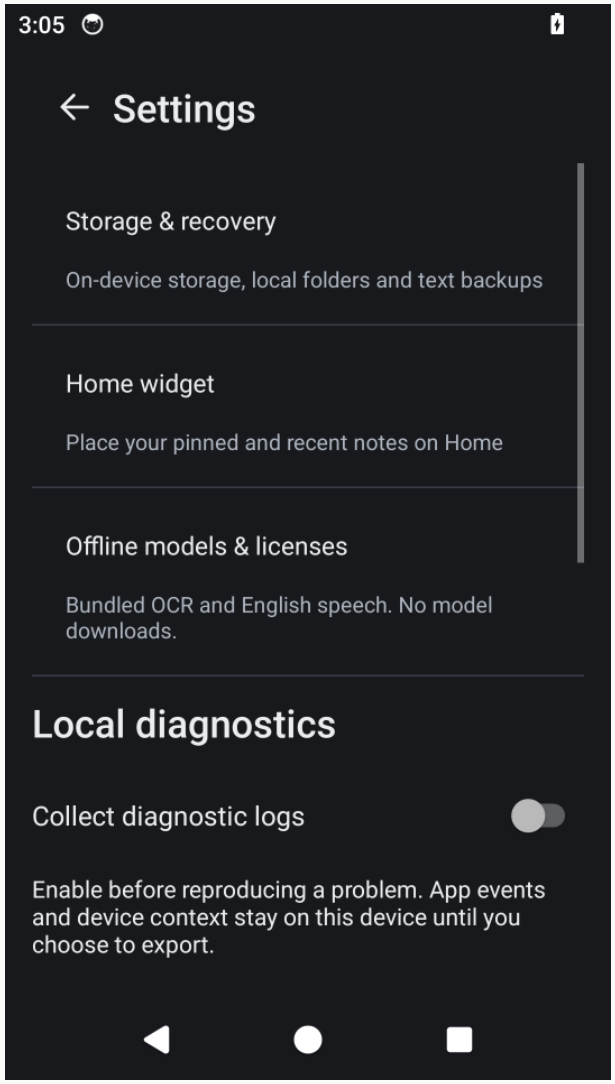

Add a shape, edit its words, connect endpoints, then move or resize. Save/reopen retains editable objects and labels. Database, curves, layers and grouping are not claimed as delivered.

Settings without a second design system

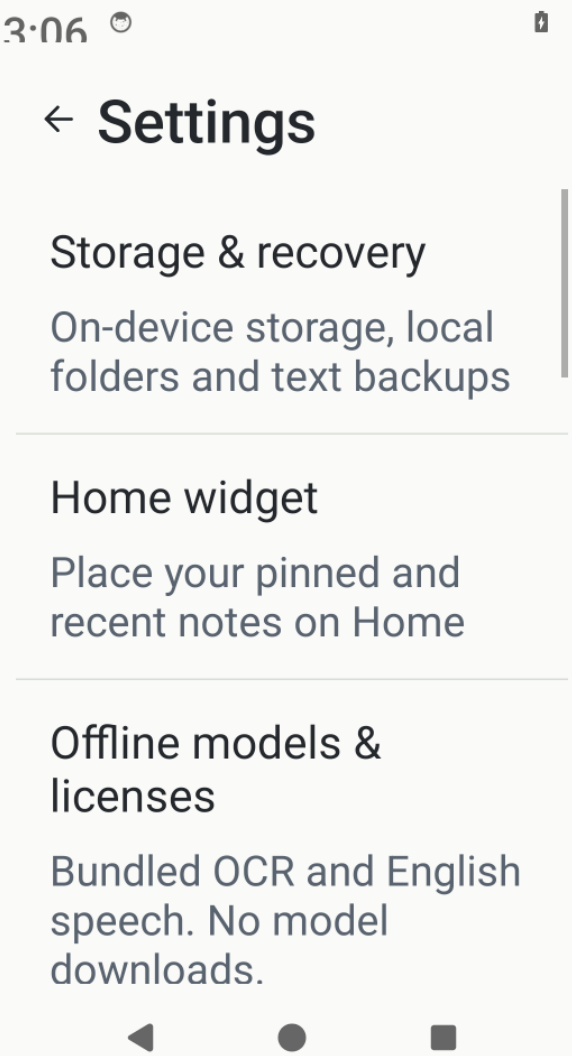

Local storage, recovery and diagnostics use the same typography, spacing and plain-language hierarchy.

Light

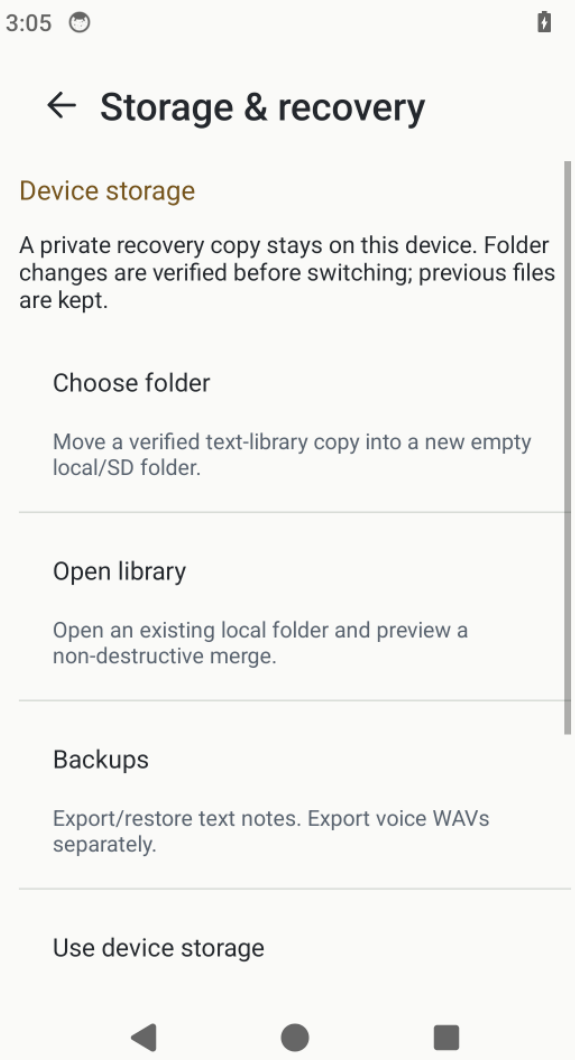

Dark

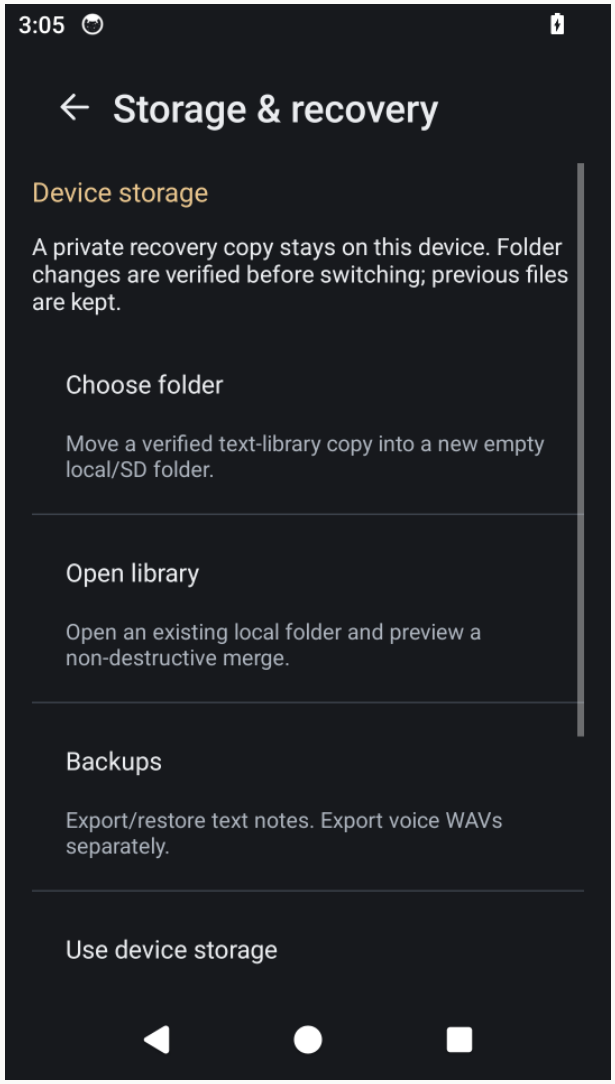

200% system font

Recovery is understandable

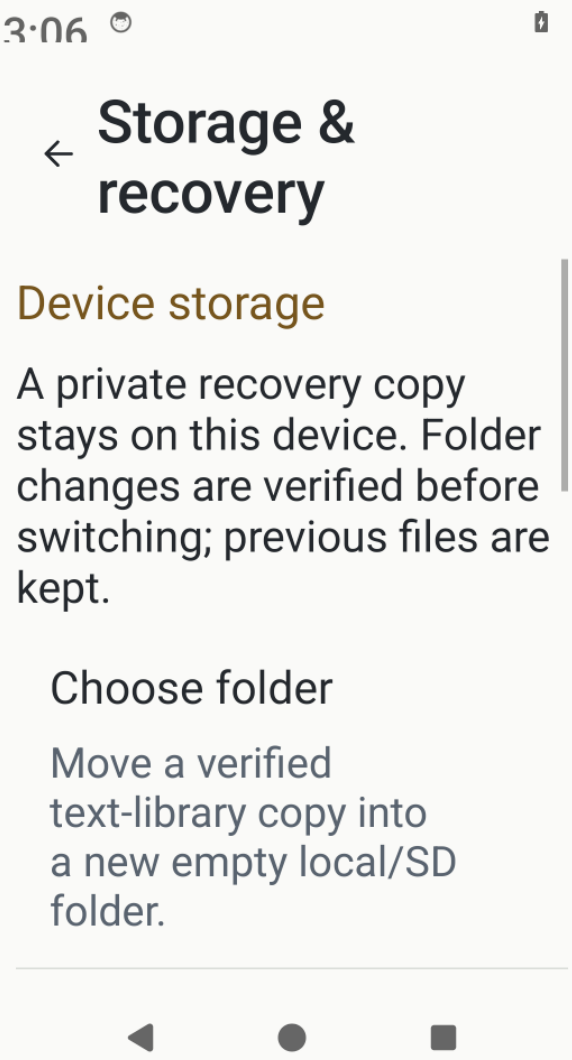

Folder selection and verified switching preserve the previous files. Long explanations wrap and scroll at 200% font.

Light

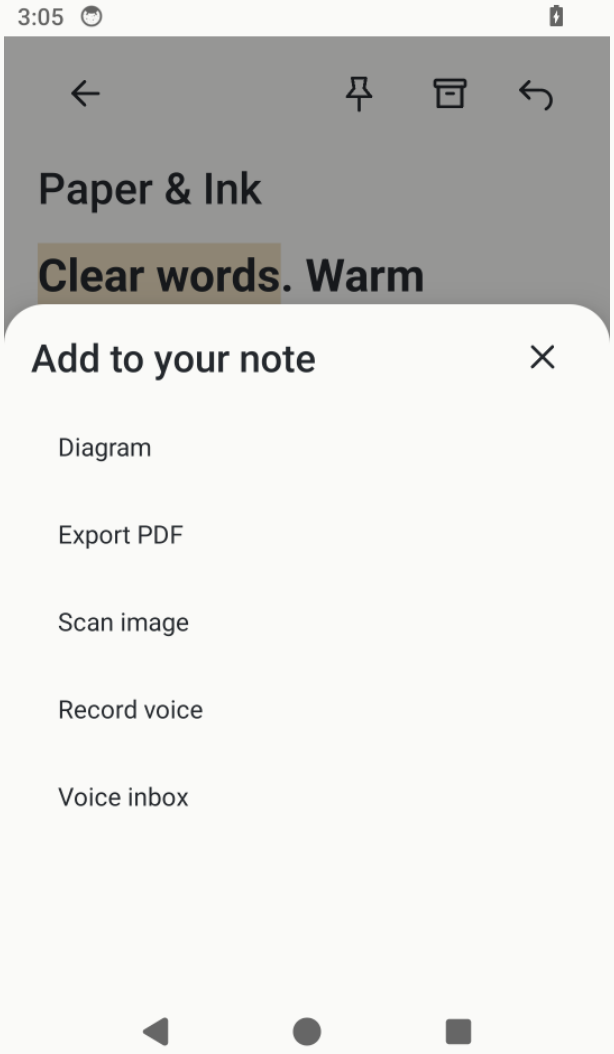

Dark

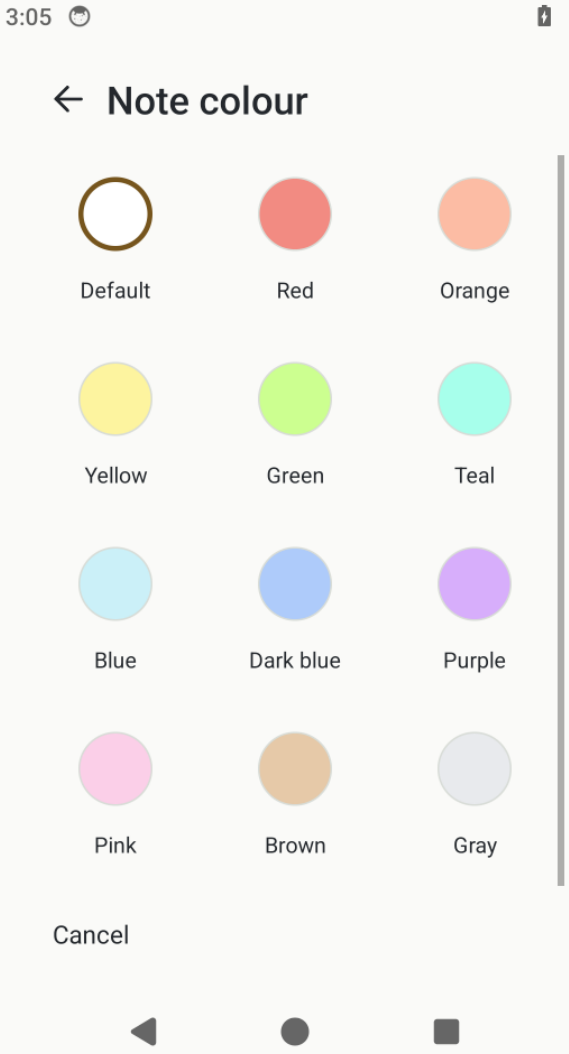

200% system font

Tools appear when they are useful

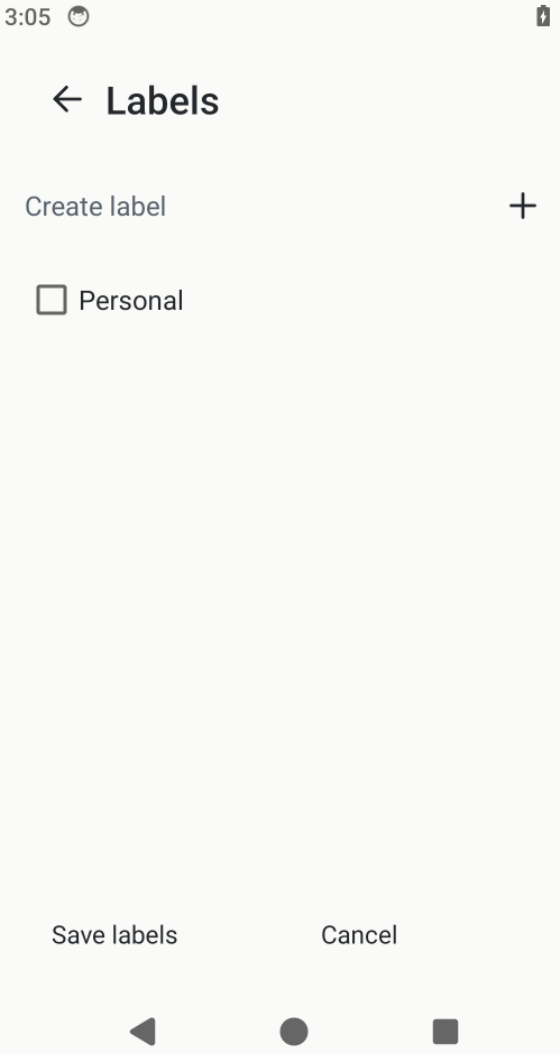

Capture is a menu, colours are labelled swatches, and labels remain editable. These are real app surfaces, not concept drawings.

Plus: add to this note

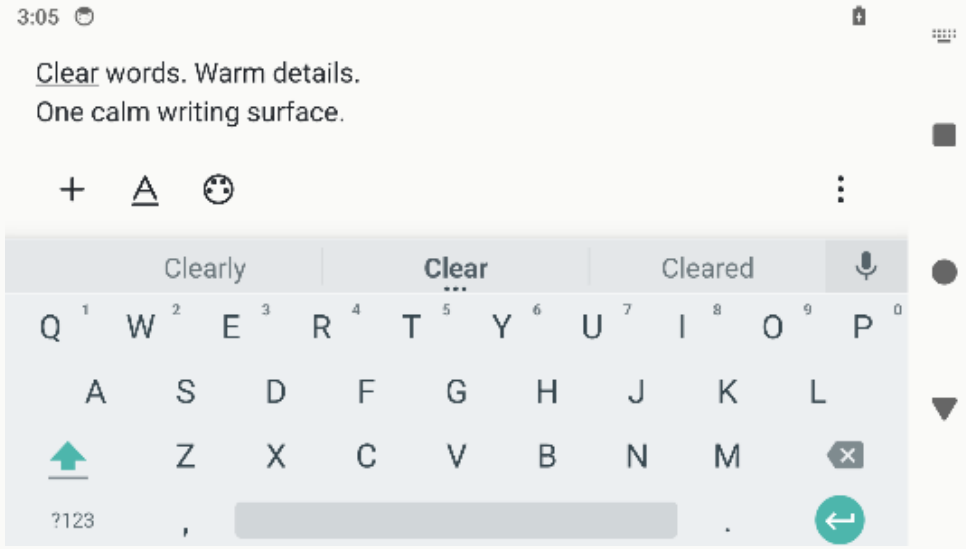

Colour: names and a selected outline

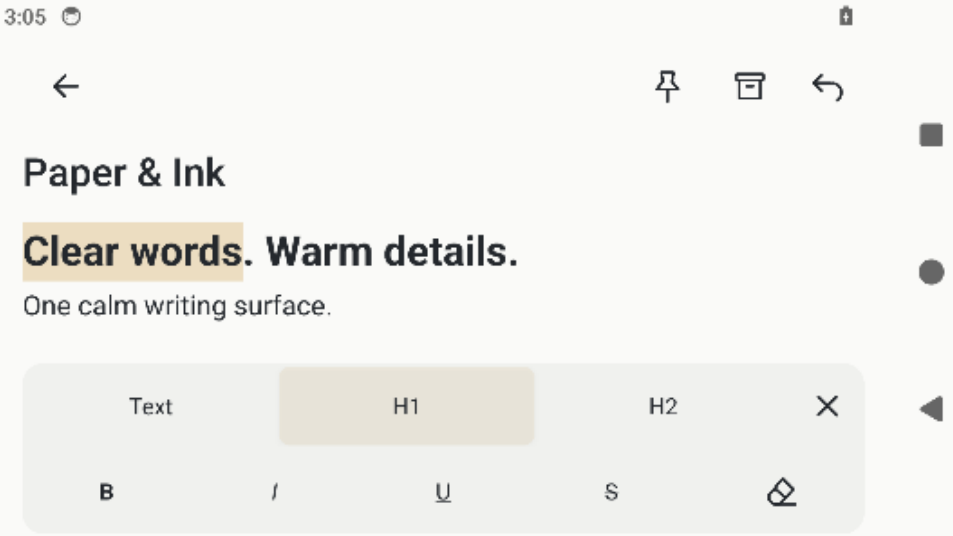

Labels: reusable organisation

Landscape and tablet are real layouts

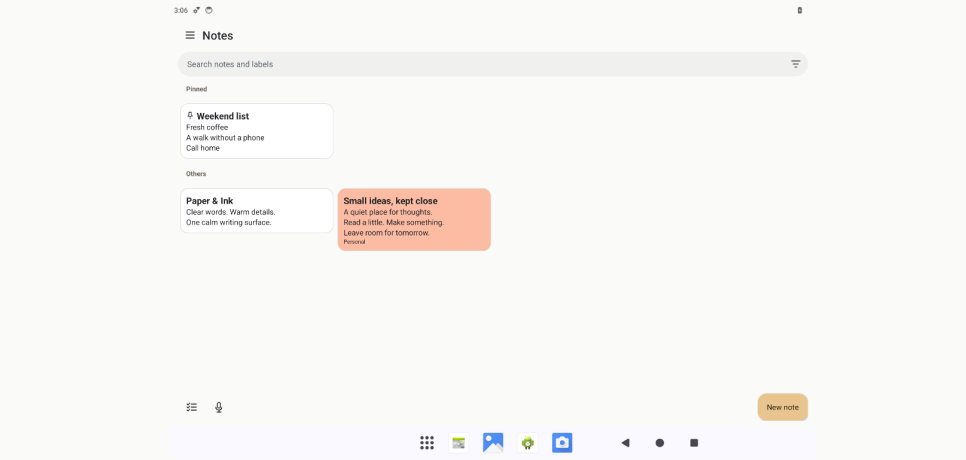

The landscape editor requests no fullscreen/extract IME. Narrow writing columns and bounded sheets avoid stretching every control across a tablet.

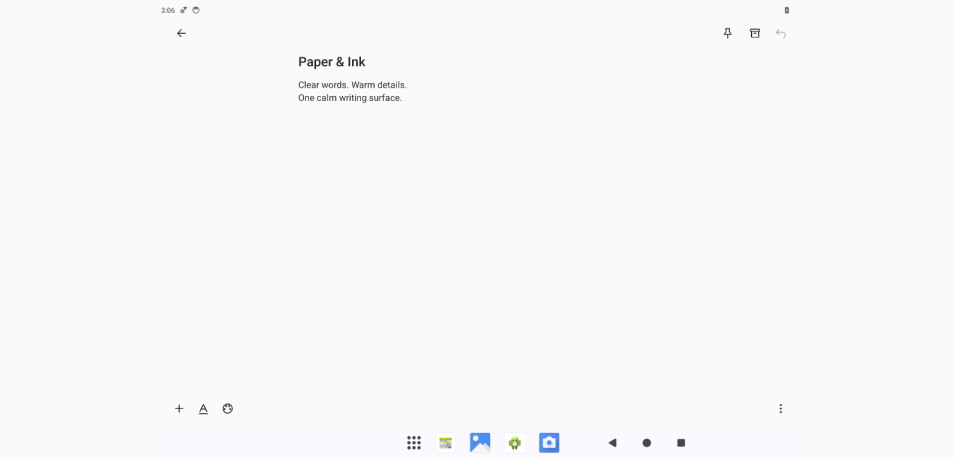

Landscape with the actual keyboard visible

Formatting in constrained height

Tablet: adaptive note-card columns

Tablet: centred document, not edge-to-edge text

What stays, and what is not claimed

The redesign removes presentation noise, not existing note capabilities. Features below describe the standalone app, not a completed universal certification.

Still available

Rich text and checklists; labels and 12 colours; search, filters and sorting; pin, Archive, seven-day Trash and Undo; copy/share and conversion; reminders and re-placeable home widget; local folder storage, generations and JSON backup/recovery.

Capture

Editable diagrams, shapes, text boxes and connectors; vector PDF export; offline OCR with bundled English/Hindi/Kannada models; optional microphone and automatic bundled offline English transcription. Original audio survives recognition failure and has playback/export/retry.

Diagram scope

The six current types are process, start/end, decision, input/output, ellipse and text box. See DIAGRAMS-AND-EXPORT-v0.5.md for exact implemented operations. Full grouping/layers/curves/smart guides are not silently claimed as complete.

Privacy and diagnostics

Collection is off by default. Enable in Settings before reproducing a problem; export or delete deliberately. Timing, device/configuration and reviewed event outcomes help investigation. Note text, titles, audio, transcripts, images, clipboard and destination URIs are not collected.

Qualification boundaries

Emulator interaction/layout/raster evidence is not physical OEM, SD-provider, TalkBack, thermal, ARM/16KiB or accent/noise validation. A native/durable component soak is not human typing. No claim of perfect compatibility or automatic aesthetic acceptance.

Install safely

Use only a gated immutable APK with the stable app.space.notes package/certificate and higher versionCode. Install over the existing app; do not uninstall or clear data. Export important JSON and original voice WAVs separately. Calculator and MySpace remain frozen.
